Qualitative Analysis

Qualitative analysis involves identification of ions (cations and anions) of a salt or a mixture of salts through their characteristic reactions. The process involves

- (i) Analysis of anions and
- (ii) Analysis of cations.

Analysis of Anions (Acidic Radicals)

Analysis of anions can be divided into two groups.

Group 'A' Radicals:

Group 'A' contains anions, which are characterised by volatile products obtained on treatment with acids. It is further divided into two sub groups.

(i) Gases liberated with dilute HCl / dilute H₂SO₄:

Carbonate (CO_3^{2-}) , bicarbonate (HCO_3^{-}) , sulphide (S^{2-}) , sulphite (SO_3^{2-}) and nitrite (NO_2^{-})

(ii) Gases or acid vapours evolved with concentrated H₂SO₄:

Fluoride (F⁻), chloride (Cl⁻), bromide (Br⁻), iodide (I⁻), nitrate (NO₃⁻), acetate (CH₃COO⁻), borate (BO₃³⁻), oxalate (C₂O₄²⁻), permanganate (MnO₄⁻) plus all anions in (i).

Group 'B' RADICALS:

Group 'B' includes anions that are characterised by their specific reactions in solutions. These reactions may be

- (i) Precipitation reactions: SO_4^{2-} , PO_4^{3-} , CrO_4^{2-} , $Cr_2O_7^{2-}$ etc.
- (ii) Oxidation and reduction in solution: CrO_4^{2-} , $Cr_2O_7^{2-}$ etc.

Group 'A' radicals

Radicals Detected With Dilute HCl / Dilute H₂SO₄:

1. Carbonate

All carbonates (CO_3^{2-}) except those of alkali metals and ammonium are insoluble in H₂O.

(a) Dilute HCl

With dilute HCl, it decomposes with effervescences due to the evolution of carbon dioxide.

$$CO_3^{2-} + 2H^+ \longrightarrow CO_2 \uparrow + H_2O$$

The gas produces white turbidity with lime water, $Ca(OH)_2$ or baryta water, $Ba(OH)_2$.

$$\begin{array}{c} CO_2 \uparrow + Ca^{2+} + 2OH^- & \longrightarrow CaCO_3 \downarrow + H_2O \\ CO_2 \uparrow + Ba^{2+} + 2OH^- & \longrightarrow BaCO_3 \downarrow + H_2O \\ \end{array}$$

It must be remembered that with prolonged passage of carbon dioxide, the turbidity slowly disappears due to the formation of soluble bicarbonate.

$$CaCO_3 \downarrow + CO_2 \uparrow + H_2O \longrightarrow Ca(HCO_3)_2$$
Soluble

(b) Barium chloride or calcium chloride solution

Carbonates on treatment with BaCl₂ or CaCl₂ gives white precipitate of barium or calcium carbonate, which is soluble in mineral acids and carbonic acid.

$$CO_3^{2-} + Ba^{2+} \longrightarrow BaCO_3 \downarrow$$
 $CO_3^{2-} + Ca^{2+} \longrightarrow CaCO_3 \downarrow$
White ppt
White ppt

(c) Silver nitrate solution

Carbonates give a white precipitate of silver carbonate with AgNO₃ solution.

$$CO_3^{2-} + 2Ag^+ \longrightarrow Ag_2CO_3 \downarrow$$
White ppt

Ag₂CO₃ precipitate is soluble in nitric acid and in ammonia. The precipitate becomes yellow or brown on addition of excess reagent owing to the formation of silver oxide. The same happens if the mixture is boiled.

$$Ag_2CO_3 \downarrow \longrightarrow Ag_2O \downarrow + CO_2 \uparrow$$
Yellow ppt

2. Bicarbonate

(a) Dilute HCl

With dilute HCl, all bicarbonates (HCO_3^-) gives effervescence due to the evolution of CO_2 .

$$HCO_3^- + H^+ \longrightarrow CO_2 \uparrow + H_2O$$

The gas gives white turbidity with lime water or baryta water.

$$CO_2 \uparrow + Ca(OH)_2 \longrightarrow CaCO_3 \downarrow + H_2O$$
White turbidity

(b) On boiling

When boiled, all bicarbonates decompose to give corresponding carbonates and carbon dioxide, which turns lime water milky.

$$2 \text{HCO}_3^- \longrightarrow \text{CO}_3^{2-} + \text{H}_2\text{O} + \text{CO}_2 \uparrow$$

(c) Test for carbonate in the presence of bicarbonate

Adding an excess of calcium chloride to a mixture of carbonate and bicarbonate, the former is precipitated quantitatively.

$$CO_3^{2-} + Ca^{2+} \longrightarrow CaCO_3 \downarrow$$
White ppt / turbidity

On filtering the solution rapidly, bicarbonate ions pass into the filtrate. On adding ammonia to the filtrate, a white precipitate or cloudiness is obtained.

$$2HCO_3^- + 2Ca^{2+} + 2NH_3 \longrightarrow 2CaCO_3 \downarrow + 2NH_4^+$$
White ppt / turbidity

3. Sulphide

(a) Dilute HCl or dilute H₂SO₄

Sulphide (S^{2-}) on treatment with dilute HCl or dilute H_2SO_4 gives a pungent smelling gas, H_2S (smell of rotten eggs).

$$S^{2-} + 2H^+ \longrightarrow H_2S^{\uparrow}$$

The blackening of filter paper moistened with lead acetate solution may identify the gas.

$$(CH_3COO)_2Pb + H_2S^{\uparrow} \longrightarrow PbS^{\downarrow} + 2CH_3COOH$$
Shining black

Alternatively, a filter paper moistened with cadmium acetate solution turns yellow.

$$H_2S^{\uparrow} + Cd^{2+} \longrightarrow CdS \downarrow + 2H^+$$

(b) Silver nitrate solution

With AgNO₃ solution, sulphides gives a black precipitate of silver sulphide insoluble in cold but soluble in hot dilute nitric acid.

$$S^{2-} + 2Ag^{+} \longrightarrow Ag_{2}S \downarrow$$
Black ppt

(c) Sodium nitroprusside solution

With sodium nitroprusside solution, ionic sulphide gives a purple colour in alkaline medium.

$$Na_2S + Na_2[Fe(CN)_5NO] \longrightarrow Na_4[Fe(CN)_5NOS]$$

No reaction occurs with solutions of hydrogen sulphide or free gas. If however, filter paper moistened with a solution of the reagent is made alkaline with sodium hydroxide or ammonia solution, a purple colouration is produced with free hydrogen sulphide also.

(d) Catalysis of iodine-azide reaction test

Solution of sodium azide, NaN_3 and iodine as I_3^- do not react, but on addition of traces of sulphide, (which acts as a catalyst) nitrogen gas is evolved immediately.

$$2\,N_3^-\!+I_3^- \xrightarrow{\quad \text{of } S^{2^-} \quad } \, 3\,I^- + 3\,N_2 \!\uparrow \,$$

Thiosulphates and thiocyanates behave similarly and hence must be absent for this test.

4. Sulphite

Only the sulphites (SO_3^{2-}) of alkali metals and ammonium are soluble in water.

(a) Dilute HCl or dilute H₂SO₄

Dilute HCl or H₂SO₄ decomposes sulphites with the evolution of sulphur dioxide.

$$SO_3^{2-} + 2H^+ \longrightarrow SO_2^{\uparrow} + H_2O$$

The gas can be identified

- (i) by suffocating odour of burning sulphur.
- (ii) by green colour formation, when passed through acidified K₂Cr₂O₇ solution.

$$3SO_2^{\uparrow} + Cr_2O_7^{2-} + 2H^+ \longrightarrow 3SO_4^{2-} + 2Cr^{3+} + H_2O$$

(iii) Lime water test

On passing SO₂ gas through lime water, a milky precipitate of calcium sulphite is formed.

$$SO_2 \uparrow + Ca(OH)_2 \longrightarrow CaSO_3 \downarrow + H_2O$$
Milky ppt

Precipitate dissolves on prolonged passage of the gas, due to the formation of calcium bisulphite.

$$CaSO_3 \downarrow + SO_2 \uparrow + H_2O \longrightarrow Ca(HSO_3)_2$$

(iv) Potassium iodate-starch paper

When the evolved gas (SO₂) comes in contact with filter paper moistened with KIO₃ and starch solution, the paper turns blue due to iodine–starch complex.

$$2KIO_3 + 5SO_2 \uparrow + 4H_2O \longrightarrow 2KHSO_4 + I_2 + 3H_2SO_4$$

(b) Barium chloride or strontium chloride solution

With BaCl₂ or SrCl₂ solution, sulphites give a white precipitate of barium sulphite or strontium sulphite.

$$SO_3^{2-} + Ba^{2+} \longrightarrow BaSO_3 \downarrow$$
White ppt
$$SO_3^{2-} + Sr^{2+} \longrightarrow SrSO_3 \downarrow$$
White ppt

The precipitate dissolves in dilute hydrochloric acid, when sulphur dioxide is liberated.

$$BaSO_3 \downarrow + 2H^+ \longrightarrow Ba^{2+} + SO_2 \uparrow + H_2O$$

On standing, the precipitate is slowly oxidised to sulphate and is then insoluble in dilute mineral acids.

5. Nitrite

All other nitrites (NO_2^-) except AgNO₂ (sparingly soluble) are soluble in H₂O.

(a) Dilute HCl

On adding dilute HCl to solid nitrite in cold produces a pale blue liquid first (due to the presence of free nitrous acid, HNO_2 or its anhydride N_2O_3) and then evolution of reddish—brown fumes of nitrogen dioxide takes place. The NO_2 is produced by the combination of nitric oxide with oxygen of the air.

$$\begin{array}{ccc} NO_{2}^{-} + H^{+} & \longrightarrow & HNO_{2} \\ 2HNO_{2} & \longrightarrow & H_{2}O + N_{2}O_{3} \\ 3HNO_{2} & \longrightarrow & HNO_{3} + 2NO^{\uparrow} + H_{2}O \\ 2NO^{\uparrow} + O_{2}^{\uparrow} & \longrightarrow & 2NO_{2}^{\uparrow} \\ & & & \text{Reddish-brown} \end{array}$$

(b) Silver nitrate solution

With silver nitrate solution, a white crystalline precipitate of AgNO₂ is obtained.

$$NO_2^- + Ag^+ \longrightarrow AgNO_2 \downarrow$$
White ppt

(c) Potassium iodide solution:

Addition of a nitrite solution to KI solution followed by acidification with CH₃COOH or dilute H₂SO₄ produces iodine, which turns starch-iodine complex blue.

$$2NO_2^- + 3I^- + 4CH_3COOH \longrightarrow I_3^- + 2NO\uparrow + 4CH_3COO^- + 2H_2O$$

(d) Brown ring test

When the nitrite solution is added carefully to a concentrated solution of iron(II) sulphate acidified with dilute acetic or dilute sulphuric acid, a brown ring appears due to the formation of $[Fe(H_2O)_5NO]SO_4$ at the junction of the two

liquids. If the addition has not been made slowly and caustiously, a brown colouration results.

$$\begin{array}{c} NO_{2}^{-} + CH_{3}COOH \longrightarrow HNO_{2} + CH_{3}COO^{-} \\ 3HNO_{2} \longrightarrow H_{2}O + HNO_{3} + 2NO^{\uparrow} \\ FeSO_{4} + 6H_{2}O \longrightarrow [Fe(H_{2}O)_{6}]SO_{4} \\ [Fe(H_{2}O)_{6}]SO_{4} + NO^{\uparrow} \longrightarrow [Fe(H_{2}O)_{5}NO]SO_{4} + H_{2}O \\ \\ Brown ring \end{array}$$

(e) Sulphamic acid (HO-SO₂-NH₂) test

When a solution of a nitrite is treated with solid sulphamic acid, it is completely decomposed.

$$HO-SO_2-NH_2 + NO_2^- \longrightarrow N_2 \uparrow + H^+ + SO_4^{2-} + H_2O$$

Since no nitrate is formed in this reaction, this is an excellent method for the complete removal of nitrite.

Radicals Detected With Concentrated H₂SO₄

6. Fluoride (F⁻)

(a) Silica and concentrated sulphuric acid

Fluorides on warming with concentrated H_2SO_4 give a colourless, corrosive gas, hydrogen fluoride (H_2F_2). The gas fumes in moist air and the test–tube acquires a greasy appearance as a result of the corrosive action of the vapour on the silica in the glass, which liberates the gas, silicon tetrafluoride, SiF_4 . By holding a moistened glass rod in the vapour, gelatinous silicic acid (H_2SiO_3) is deposited on the rod, which is a product of the decomposition of the silicon tetrafluoride.

$$2F^{-} + H_2SO_4 \longrightarrow H_2F_2\uparrow + SO_4^{2-}$$

 $SiO_2 + 2H_2F_2 \longrightarrow SiF_4\uparrow + 2H_2O$
 $3SiF_4\uparrow + 3H_2O \longrightarrow 2[SiF_6]^{2-} + H_2SiO_3\downarrow + 4H^{+}$

Note that at room temperature hydrogen fluoride gas is almost completely dimerized, therefore its formula has been written as H₂F₂. At elevated temperatures (say 90°C), it dissociates completely to monomeric hydrogen fluoride.

$$H_2F_2(g) \xrightarrow{\text{above}} 2HF(g)$$

(b) The etching test

A clean watch glass is coated on the convex side with paraffin wax and scratching a design on the wax with a nail exposes part of the glass. A mixture of fluoride salt and concentrated sulphuric acid is placed in a small lead or platinum crucible and the latter immediately covered with the watch glass, convex side down. A little water should be poured in the upper (concave) side of the watch glass to prevent the wax from melting. The crucible is very gently warmed. After 5–10 minutes, the hydrogen fluoride would etch the glass.

(c) Silver nitrate solution

With silver nitrate solution, no precipitate is obtained, as silver fluoride is soluble in water.

(d) Calcium chloride solution

With calcium chloride solution, a white, slimy precipitate of calcium fluoride (CaF₂), sparingly soluble in acetic acid but slightly more soluble in dilute hydrochloric acid is formed.

$$2F^- + Ca^{2+} \longrightarrow CaF_2 \downarrow$$
White slimy ppt

7. Chloride (Cl⁻)

Most chlorides are soluble in water except Hg₂Cl₂, CuCl, AgCl, PbCl₂, BiOCl and SbOCl. PbCl₂ is soluble in hot water.

(a) Concentrated H₂SO₄

With concentrated H₂SO₄, chlorides gives vapours of HCl.

$$Cl^- + H_2SO_4 \longrightarrow HCl\uparrow + HSO_4^-$$

Vapour evolved

- (i) turns blue litmus paper red.
- (ii) gives white fumes of NH₄Cl when a glass rod moistened with aqueous ammonia solution is brought close to the mouth of test tube.

(b) Manganese dioxide and concentrated sulphuric acid

When a solid chloride is treated with MnO_2 and concentrated H_2SO_4 , yellowish–green coloured gas (Cl_2) is evolved.

$$MnO_2 + 2H_2SO_4 + 2Cl^- \longrightarrow Mn^{2+} + Cl_2 \uparrow + 2SO_4^{2-} + 2H_2O$$
Yellowish green

(c) Silver nitrate solution

Chlorides on treatment with AgNO₃ solution gives a white curdy precipitate of AgCl insoluble in water and in dilute nitric acid but soluble in dilute ammonia solution due to the formation of soluble complex.

$$Cl^{-} + Ag^{+} \longrightarrow \underset{\text{White curdy ppt}}{AgCl} \downarrow$$
 $AgCl \downarrow + 2NH_{3} \longrightarrow [Ag(NH_{3})_{2}]Cl$
Soluble

(d) Lead acetate solution

With (CH₃CO₂)₂Pb solution, chlorides gives a white precipitate of lead chloride.

$$2Cl^- + Pb^{2+} \longrightarrow PbCl_2 \downarrow$$
White ppt

(e) Chromyl chloride test

When a mixture containing chloride ion is heated with K₂Cr₂O₇ & concentrated H₂SO₄, deep orange–red fumes of chromyl chloride (CrO₂Cl₂) are formed.

$$K_2Cr_2O_7 + 4NaCl + 6H_2SO_4 \longrightarrow 2KHSO_4 + 4NaHSO_4 + 2CrO_2Cl_2 \uparrow + 3H_2O_4 + 4NaHSO_4 + 2CrO_2Cl_2 \uparrow + 3H_2O_4 +$$

When chromyl chloride vapours are passed into sodium hydroxide solution, a yellow solution of sodium chromate is formed, which when treated with lead acetate gives yellow precipitate of lead chromate.

$$CrO_2Cl_2\uparrow + 2NaOH \longrightarrow Na_2CrO_4 + 2HCl$$
 $Yellow solution$
 $Na_2CrO_4 + (CH_3COO)_2Pb \longrightarrow 2CH_3COONa + PbCrO_4\downarrow$
 $Yellow ppt$

This test is given by ionic chlorides only. Chlorides of Hg²⁺, Pb²⁺, Ag⁺, Sn²⁺ & Sb³⁺ do not respond to chromyl chloride test due to their covalent character, which allows them to ionise only slightly.

8. Bromide (Br⁻)

All bromides are soluble in water except AgBr, Hg₂Br₂, CuBr and PbBr₂ (soluble in boiling water).

(a) Concentrated H₂SO₄

If concentrated sulphuric acid is poured in a bromide solution, first a reddish-brown solution is formed, later reddish-brown vapours of bromine accompany the hydrogen bromide.

$$2KBr + H2SO4 \longrightarrow K2SO4 + 2HBr↑$$

$$2HBr + H2SO4 \longrightarrow 2H2O + SO2↑ + Br2↑$$
Reddish-brown

If concentrated H₃PO₄ is used instead of H₂SO₄ and the mixture is warmed, only hydrogen bromide is formed.

$$KBr + H_3PO_4 \longrightarrow HBr^{\uparrow} + KH_2PO_4$$

(b) Manganese dioxide and concentrated sulphuric acid

When a mixture of solid bromide, MnO₂ and concentrated H₂SO₄ is heated, reddish–brown vapours of bromine are evolved.

$$2KBr + MnO_2 + 2H_2SO_4 \longrightarrow Br_2 \uparrow + K_2SO_4 + MnSO_4 + 2H_2O_4$$
Reddish-brown

(c) Silver nitrate solution

With AgNO₃ solution, bromide gives a curdy pale yellow precipitate of silver bromide. This precipitate is sparingly soluble in dilute ammonia but readily soluble in concentrated ammonia solution and insoluble in dilute HNO₃.

$$Br^- + Ag^+ \longrightarrow AgBr \downarrow$$
Pale yellow ppt

(d) Lead acetate solution

Bromides on treatment with lead acetate solution, gives a white crystalline precipitate of lead bromide, which is soluble in boiling water.

$$2Br^{-} + Pb^{2+} \longrightarrow PbBr_{2} \downarrow$$
White ppt

(e) Chlorine water

When chlorine water is added to a solution of bromide, free bromine is liberated, which colours the solution orange—red. If CS₂, CHCl₃ or CCl₄ is added to the solution and the liquid shaken, the bromine dissolves in the organic solvent and after allowing to stand forms a reddish—brown solution below the colourless aqueous layer.

$$2KBr + Cl_2(water) \longrightarrow 2KCl + Br_2$$

 $Br_2 + Chloroform \longrightarrow Reddish-brown solution$

With excess of chlorine water, the bromine is converted into yellow bromine monochloride and a pale yellow solution results.

$$Br_2\uparrow + Cl_2\uparrow \longrightarrow 2BrCl$$

Pale yellow solution

(f) Potassium dichromate and concentrated H₂SO₄

When a mixture of solid bromide, $K_2Cr_2O_7$ and concentrated H_2SO_4 is heated and passing the evolved vapours into water, a orange–red solution is obtained.

$$6KBr + K_2Cr_2O_7 + 7H_2SO_4 \longrightarrow 3Br_2 \uparrow + Cr_2(SO_4)_3 + 4K_2SO_4 + 7H_2O$$
Orange-red solution

9. Iodide (**I**⁻)

Iodides are generally soluble in water except AgI, Hg₂I₂, HgI₂, CuI and PbI₂.

(a) Concentrated H₂SO₄

With concentrated H₂SO₄, iodides gives violet vapours of iodine on warming.

$$2I^{-} + 2H_{2}SO_{4} \longrightarrow I_{2}^{\uparrow} + SO_{4}^{2-} + 2H_{2}O + SO_{2}^{\uparrow}$$
Violet vapours

(b) Silver nitrate solution

With AgNO₃ solution, iodides form a yellow curdy precipitate of silver iodide, which is very slightly soluble in concentrated ammonia solution, but is completely insoluble in dilute HNO₃.

$$I^- + Ag^+ \longrightarrow AgI \downarrow$$
Yellow curdy ppt

(c) Lead acetate solution

With (CH₃CO₂)₂Pb solution, a yellow precipitate of lead iodide (PbI₂) is formed, which is soluble in hot water forming a colourless solution and yielding golden–yellow plates on cooling.

$$2I^- + Pb^{2+} \longrightarrow PbI_2 \downarrow$$
Yellow ppt

(d) Potassium dichromate and concentrated sulphuric acid

When iodides are warmed with K₂Cr₂O₇ and concentrated H₂SO₄, iodine is liberated.

$$6I^- + Cr_2O_7^{2-} + 2H_2SO_4 \longrightarrow 3I_2\uparrow + 2Cr^{3+} + 7SO_4^{2-} + 7H_2O$$
Violet vapours

(e) Chlorine water

When this reagent is added dropwise to a solution of an iodide, free iodine is liberated, which colours the solution brown and on shaking with CS₂, CHCl₃ or

CCl₄, it dissolves in organic layer forming a violet solution, which settles below the aqueous layer.

$$2KI + Cl_2 \longrightarrow I_2 + 2KCl$$

 I_2 + Chloroform \longrightarrow Violet solution

(f) Copper sulphate solution

With $CuSO_4$ solution, iodide produces a brown precipitate consisting of a mixture of copper(I) iodide and iodine. On addition of hypo $(Na_2S_2O_3)$ to the solution, brown precipitate changes to white (colourless).

$$4I^{-} + 2Cu^{2+} \longrightarrow Cu_{2}I_{2} \downarrow + I_{2}$$
Brown ppt
$$I_{2} + 2S_{2}O_{3}^{2-} \longrightarrow 2I^{-} + S_{4}O_{6}^{2-}$$

(g) Mercury(II) chloride solution

With HgCl₂ solution, iodide gives a scarlet precipitate of HgI₂.

$$2I^{-} + HgCl_{2} \longrightarrow HgI_{2} \downarrow + 2Cl^{-}$$

Scarlet ppt

The precipitate dissolves in excess of KI, forming water soluble tetraiodomercurate(II) complex.

$$HgI_2 + 2I^- \longrightarrow [HgI_4]^{2-}$$

10. Nitrate

All nitrates (NO_3^-) are soluble in water. The nitrates of mercury and bismuth give basic salts on treatment with H₂O but are soluble in dilute nitric acid.

(a) Concentrated H₂SO₄

Nitrates produce reddish-brown vapours of nitrogen dioxide on treatment with concentrated H₂SO₄.

$$4NO_3^- + 2H_2SO_4 \longrightarrow 4NO_2^{\uparrow} + 2SO_4^{2-} + 2H_2O + O_2^{\uparrow}$$
Reddish-brown vapours

(b) Brown ring test

When a freshly prepared saturated solution of iron(II) sulphate is added to nitrate solution and then concentrated H₂SO₄ is added slowly from the side of the test tube, a brown ring is obtained at the junction of two layers.

$$2NO_3^- + 4H_2SO_4 + 6Fe^{2+} \longrightarrow 6Fe^{3+} + 2NO^{\uparrow} + 4SO_4^- + 4H_2O^{\uparrow}$$

On shaking and warming the mixture the brown colour disappears, nitric oxide is evolved and a yellow solution of iron(III) ions remains.

Bromides and iodides interfere because of the liberated halogen. This test is not trustworthly in the presence of chromates, sulphites, thiosulphates and iodates. All of these anions can be removed by adding an excess of nitrate-free Ag₂SO₄ and filtering the insoluble silver salts.

11. Acetate

(a) Dilute sulphuric acid

On adding a small quantity of dilute H_2SO_4 to the acetate $(CH_3CO_2^-)$ salt, acetic acid is produced, which can be easily recognized by its vinegar–like odour.

$$CH_3COO^- + H^+ \longrightarrow CH_3COOH$$

Vinegar–like odour

(b) Iron(III) chloride solution

With FeCl₃ solution, acetates give a deep-red colouration due to the formation of ferric acetate.

$$3CH_3COONa + FeCl_3 \longrightarrow (CH_3COO)_3Fe + 3NaCl$$

Blood red colouration

(c) Silver nitrate solution

Acetates on treatment with AgNO₃ solution give a white crystalline precipitate of silver acetate.

$$CH_3COO^- + Ag^+ \longrightarrow CH_3COOAg \downarrow$$
White ppt

(d) Cacodyl oxide reaction

Acetate salt on heating with solid As_2O_3 gives cacodyl oxide, which have an extremely nauseating odour. The cacodyl oxide is poisonous also.

$$4CH3CO2Na + As2O3 \longrightarrow CH3 As-O-As CH3 + 2Na2CO3 + 2CO2 \uparrow$$

$$CH3 CH3 CH3 + 2Na2CO3 + 2CO2 \uparrow$$

Cacodyl oxide (nauseating odour)

12. Borate

(a) Concentrated H₂SO₄

On heating borate (BO₃³⁻) salts with concentrated sulphuric acid, white fumes of boric acid are evolved. If concentrated hydrochloric acid is added to a concentrated solution of borax, boric acid is precipitated.

$$Na_{2}B_{4}O_{7} + H_{2}SO_{4} + 5H_{2}O \longrightarrow 4H_{3}BO_{3}^{\uparrow} + 2Na^{+} + SO_{4}^{2-}$$
White fumes
$$Na_{2}B_{4}O_{7} + 2HCl + 5H_{2}O \longrightarrow 4H_{3}BO_{3}^{\downarrow} + 2Na^{+} + 2Cl^{-}$$

(b) Concentrated sulphuric acid and alcohol (flame test)

When a little borax is mixed with some concentrated sulphuric acid and methanol or ethanol (the former is preferred because of its greater volatility) in a small porcelain dish and the alcohol ignited, the latter will burn with a greenedged flame, due to the formation of methyl borate, $B(OC_2H_5)_3$.

$$H_3BO_3 + 3CH_3OH \longrightarrow B(OCH_3)_3\uparrow + 3H_2O$$
 $Green\ edged$
 $H_3BO_3 + 3C_2H_5OH \longrightarrow B(OC_2H_5)_3\uparrow + 3H_2O$
 $Green\ edged$

13. Oxalate

(a) Silver nitrate solution

With silver nitrate solution, a white curdy precipitate of silver oxalate $(C_2O_4^{2-})$ sparingly soluble in water, soluble in ammonia solution and in dilute nitric acid is obtained.

$$(COO)_2^{2^-} + 2Ag^+ \longrightarrow (COOAg)_2 \downarrow$$
 White curdy ppt
 $(COOAg)_2 \downarrow + 4NH_3 \longrightarrow 2[Ag(NH_3)_2]^+ + (COO)_2^{2^-}$
 $(COOAg)_2 \downarrow + 2H^+ \longrightarrow 2Ag^+ + (COO)_2^{2^-} + 2H^+$

(b) Calcium chloride solution

With calcium chloride solution, a white crystalline precipitate of calcium oxalate from neutral solutions is obtained, which is insoluble in dilute acetic acid and oxalic acid but soluble in dilute hydrochloric acid and in dilute nitric acid.

$$(COO)_2^{2-} + Ca^{2+} \longrightarrow (COO)_2Ca \downarrow \text{ White ppt}$$

(c) Potassium permanganate solution

Potassium permanganate solution gets decolourized when warmed in acid solution with an oxalate salt to 60°C. Many other organic compounds also effect the bleaching of permanganate but if the evolved carbon dioxide is tested by the lime water reaction, the test becomes specific for oxalates.

$$5(COO)_{2}^{2-} + 2MnO_{4}^{-} + 16H^{+} \longrightarrow 10CO_{2}^{\uparrow} + 2Mn^{2+} + 8H_{2}O$$

14. Permaganate

All permanganates (MnO₄) are soluble in water forming purple solutions.

(a) Hydrogen peroxide

H₂O₂ decolourises acidified permanganate solution.

$$2MnO_4^- + 5H_2O_2 + 6H^+ \longrightarrow 5O_2^+ + 2Mn^{2+} + 8H_2O$$

(b) Iron(II) sulphate solution

Iron(II) sulphate solution in the presence of sulphuric acid, reduces permanganate to manganese(II). The solution becomes yellow because of the formation of iron(III) ions.

$$MnO_4^- + 5Fe^{2+} + 8H^+ \longrightarrow 5Fe^{3+} + Mn^{2+} + 4H_2O$$

Group 'B' Radicals

15. Sulphate

Sulphates (SO₄²⁻) of barium, strontium and lead are practically insoluble in water, those of calcium and mercury(II) are slightly soluble and most of the remaining metallic sulphates are soluble.

(a) Barium chloride solution

On adding BaCl₂ solution to a sulphate salt solution, a white precipitate of barium sulphate (BaSO₄) insoluble in warm dilute hydrochloric acid and in dilute nitric acid but moderately soluble in boiling concentrated hydrochloric acid is formed.

$$SO_4^{2-} + Ba^{2+} \longrightarrow \begin{array}{c} BaSO_4 \downarrow \\ White \ ppt \end{array}$$

(b) Silver nitrate solution

With silver nitrate solution, so²- gives a white crystalline precipitate of silver sulphate.

$$SO_4^{2-} + 2Ag^+ \longrightarrow Ag_2SO_4 \downarrow$$
White ppt

(c) Mercury(II) nitrate solution

With $Hg(NO_3)_2$ solution, sulphates form a yellow precipitate of basic mercury(II) sulphate.

$$SO_4^{2-} + 3Hg^{2+} + 2H_2O \longrightarrow HgSO_4.2HgO \downarrow + 4H^+$$

Yellow ppt

16. Phosphate

(a) Barium chloride solution

With barium chloride solution, a white amorphous precipitate of barium phosphate, Ba₃(PO₄)₂ is formed from neutral solutions, soluble in dilute mineral acids and in acetic acid.

$$2PO_4^{3-} + 3Ba^{2+} \longrightarrow Ba_3(PO_4)_2 \downarrow$$
White ppt

(b) Silver nitrate solution

With silver nitrate solution, a yellow precipitate of silver orthophosphate, Ag₃PO₄ is formed, soluble in dilute ammonia solution and in dilute nitric acid.

$$PO_4^{3-} + 3Ag^+ \longrightarrow Ag_3PO_4 \downarrow$$

 $Yellow ppt$
 $Ag_3PO_4 \downarrow + 6NH_3 \longrightarrow 3[Ag(NH_3)_2]^+ + PO_4^{3-}$
 $Ag_3PO_4 \downarrow + 2H^+ \longrightarrow H_2PO_4^- + 3Ag^+$

(c) Ammonium molybdate reagent

When ammonium molybdate is treated with a solution containing phosphate, a yellow crystalline precipitate of ammonium phosphomolybdate (ammonium dodecamolybdatophosphate), $(NH_4)_3[PMo_{12}O_{40}]$ or $(NH_4)_3[P(Mo_3O_{10})_4]$ is formed. In the compound formed, the Mo_3O_{10} group replaces each oxygen atom in phosphate.

$$PO_{4}^{3-} + 3NH_{4}^{+} + 12MoO_{4}^{2-} + 24H^{+} \longrightarrow (NH_{4})_{3}[P(Mo_{3}O_{10})_{4}] \downarrow + 12H_{2}O$$
Yellow ppt

17. Chromate and Dichromate

The chromates (CrO_4^{2-}) of the alkali metals, calcium and magnesium are soluble in water. $SrCrO_4$ is sparingly soluble. Most other metallic chromates are insoluble in H_2O . Metallic chromates give yellow solution when dissolved in water. In the presence of H^+ ion, chromates are converted into dichromates (orange–red solution). On adding alkalies i.e. hydroxyl ions, the colour again becomes yellow due to the formation of CrO_4^{2-} back.

$$2CrO_4^{2-} + 2H^+ \Longrightarrow Cr_2O_7^{2-} + H_2O$$

 $Cr_2O_7^{2-} + 2OH^- \Longrightarrow 2CrO_4^{2-} + H_2O$

The reaction may also be expressed as

$$2CrO_4^{2-} + 2H^+ \implies 2HCrO_4^- \implies Cr_2O_7^{2-} + H_2O$$

(a) Barium chloride solution

With BaCl₂ solution, CrO₄²⁻ gives a pale yellow precipitate of barium chromate, soluble in dilute mineral acids but insoluble in water and acetic acid.

$$CrO_4^{2-} + Ba^{2+} \longrightarrow BaCrO_4 \downarrow$$
Pale yellow ppt

Dichromate ion also gives the same precipitate but as a strong acid is formed, precipitation is only partial.

$$Cr_2O_7^{2-} + 2Ba^{2+} + H_2O \implies 2BaCrO_4 \downarrow + 2H^+$$

Pale yellow ppt

If sodium hydroxide or sodium acetate is added, precipitation becomes quantitative.

(b) Silver nitrate solution

CrO₄² on treatment with silver nitrate solution gives a brownish - red precipitate of silver chromate, which is soluble in dilute nitric acid and in ammonia solution but is insoluble in acetic acid. HCl converts the precipitate into silver chloride.

$$CrO_4^{2^-} + 2Ag^+ \longrightarrow Ag_2CrO_4 \downarrow$$
Brownish-red ppt
$$2Ag_2CrO_4 \downarrow + 2H^+ \stackrel{\Delta}{\longrightarrow} 4Ag^+ + CrO_4^{2^-} + H_2O$$

$$Ag_2CrO_4 \downarrow + 4NH_3 \longrightarrow 2[Ag(NH_3)_2]^+ + CrO_4^{2^-}$$

$$Ag_2CrO_4\downarrow + 2Cl^- \longrightarrow 2AgCl\downarrow + CrO_4^{2-}$$
White ppt

A reddish-brown precipitate of silver dichromate, Ag₂Cr₂O₇ is formed with a concentrated solution of a dichromate, which on boiling with water gets converted into less soluble silver chromate.

$$CrO_4^{2-} + 2Ag^+ \longrightarrow Ag_2Cr_2O_7 \downarrow$$
Reddish-brown ppt
$$Ag_2Cr_2O_7 \downarrow + H_2O \stackrel{\triangle}{\longrightarrow} Ag_2CrO_4 + CrO_4^{2-} + 2H^+$$

(c) Lead acetate solution

With lead acetate solution, CrO_4^{2-} gives a yellow precipitate of lead chromate (PbCrO₄), insoluble in acetic acid but soluble in dilute nitric acid.

$$CrO_4^{2-} + Pb^{2+} \longrightarrow PbCrO_4 \downarrow Yellow ppt$$

 $2PbCrO_4 \downarrow + 2H^+ \Longrightarrow 2Pb^{2+} + Cr_2O_7^{2-} + H_2O$

The precipitate is soluble in sodium hydroxide solution and acetic acid reprecipitates lead chromate.

(d) Hydrogen peroxide

If an acidic solution of a chromate is treated with H_2O_2 in the presence of ether/amyl alcohol, a deep-blue solution of chromium pentoxide or chromic peroxide is obtained in ethereal layer.

$$CrO_4^{2-} + 2H^+ + 2H_2O_2 \longrightarrow CrO_5 + 3H_2O$$

Deep-blue colouration

CrO₅ is unstable and it decomposes yielding oxygen and a green solution of Cr³⁺ in the absence of ether /amyl alcohol.

Analysis of Cations (Basic Radicals)

Classification of cations

For the purpose of systematic qualitative analysis of cations, they are divided into five groups and the classification is based on whether a cation reacts with the given group reagent by the formation of a precipitate or not.

Group reagents

Hydrochloric acid, hydrogen sulphide, ammonium hydroxide and ammonium carbonate.

Group	Group Reagent	Ions	Nature of precipitate and their colour
Group I	dilute HCl	Pb ²⁺ , Hg ₂ ²⁺ , Ag ⁺	PbCl ₂ , HgCl ₂ , AgCl - white
Group II A	H ₂ S in dilute HCl	Ag ⁺ Pb ²⁺ , Hg ²⁺ , Cu ²⁺ , Bi ³⁺ , Cd ²⁺ As ³⁺ , As ⁵⁺ , Sb ³⁺ , Sb ⁵⁺ , Sn ²⁺ , Sn ⁴⁺	As ₂ S ₃ , As ₂ S ₅ , CdS, SnS ₂ –Yellow HgS, CuS, PbS–Black Sb ₂ S ₃ , Sb ₂ S ₅ –Orange Bi ₂ S ₃ , SnS–Brown
Group II B			
Group III A	NH ₄ OH in presence of NH ₄ Cl	Fe ³⁺ , Al ³⁺ , Cr ³⁺	Fe(OH) ₃ –Brown, Al(OH) ₃ –White, Cr(OH) ₃ –Green
Group III B	H ₂ S in presence of NH ₄ OH & NH ₄ Cl	Ni ²⁺ , Co ²⁺ , Mn ²⁺ , Zn ²⁺	ZnS–White, MnS – Buff, CoS, NiS–Black
Group IV	(NH ₄) ₂ CO ₃ in presence of NH ₄ Cl and NH ₄ OH	Ba ²⁺ , Sr ²⁺ , Ca ²⁺	BaCO ₃ , SrCO ₃ , CaCO ₃ –White
Group V	No common group reagent	Mg ²⁺ , Na ⁺ , K ⁺ ,	

It should be noted that:

- (i) Group I radicals (Ag⁺, Pb²⁺, Hg₂²⁺) are precipitated as chlorides because the solubility product of these chlorides (AgCl, PbCl₂, Hg₂Cl₂) is less than the solubility products of chlorides of all other metal ions, which remain in solution.
- (ii) Group II radicals are precipitated as sulphides because of their low solubility, whereas sulphides of other metals remain in solution because of

their high solubility products. HCl acts as a source of H^+ , which decreases the concentration of S^{2-} due to common ion effect. Hence, the decreased concentration of S^{2-} is only sufficient to precipitate the Group II metals ions as sulphides.

- (iii) Group III A radicals are precipitated as hydroxides and the NH₄Cl suppresses the ionisation of NH₄OH so that only the group III A cations are precipitated as hydroxides because of their low solubility product.
 - (a) Excess of NH₄Cl should not be added, else manganese will precipitate as MnO₂.H₂O.
 - (b) $(NH_4)_2SO_4$ cannot be used in place of NH_4Cl because the so_4^{2-} will give precipitate of $BaSO_4$.
 - (c) NH_4NO_3 cannot be used in place of NH_4Cl as NO_3^- ions will oxidise Mn^{2+} to Mn^{3+} and thus, $Mn(OH)_3$ will be precipitated in III A group.
- (iv) Ammonium hydroxide increases the ionisation of H₂S by removing H⁺ from H₂S as unionised water.

$$H_2S \Longrightarrow 2H^+ + S^{2-}$$
 , $H^+ + OH^- \longrightarrow H_2O$

Now the excess of S^{2-} ions is available and hence the ionic product of group III B exceeds their solubility product and will be precipitated. In case H_2S is passed through a neutral solution, incomplete precipitation will take place due to the formation of HCl, which decreases the ionisation of H_2S . For example,

$$MnCl_2 + H_2S \longrightarrow MnS + 2HCl$$

Group - I Radicals (Pb²⁺, Ag⁺, Hg₂²⁺)

On adding dilute HCl to the salt solution if white precipitate is obtained, it indicates the presence of Pb^{2+} , Ag^+ or Hg_2^{2+} ion in the solution.

18. Lead (II)

(a) Sodium hydroxide solution

With NaOH, Pb²⁺ forms a white precipitate of lead hydroxide. The precipitate dissolves in excess reagent to form tetrahydroxyplumbate(II) ions.

$$Pb^{2+} + 2OH^{-} \longrightarrow Pb(OH)_{2} \downarrow$$
White ppt
$$Pb(OH)_{2} \downarrow +2OH^{-} \longrightarrow [Pb(OH)_{4}]^{2-}$$
Soluble

(b) Ammonia solution

With ammonia solution, Pb²⁺ gives a white precipitate of lead hydroxide.

$$Pb^{+2} + 2NH_4OH \longrightarrow Pb(OH)_2 \downarrow + 2NH_4^+$$
White ppt

The precipitate is insoluble in excess reagent.

(c) Potassium chromate solution

PbCl₂ is soluble in hot water and gives a yellow precipitate with K₂CrO₄. The precipitate obtained is insoluble in acetic acid but soluble in NaOH & nitric acid.

$$PbCl_{2} + K_{2}CrO_{4} \longrightarrow PbCrO_{4} \downarrow + 2KCl$$

$$Yellow ppt$$

$$PbCrO_{4} \downarrow + 4NaOH \longrightarrow Na_{2}[Pb(OH)_{4}] + Na_{2}CrO_{4}$$

$$PbCrO_{4} \downarrow + 2H^{+} \longrightarrow 2Pb^{2+} + Cr_{2}O_{7}^{2-} + H_{2}O$$

(d) Potassium iodide solution

PbCl₂ on addition of KI solution gives bright yellow precipitate of PbI₂.

$$PbCl_2 + 2KI \longrightarrow PbI_2 \downarrow + 2KCl$$

Yellow ppt

The precipitate is moderately soluble in boiling water to yield a colourless solution, from which it separates as golden yellow plates on cooling.

Yellow precipitate dissolves on adding excess of potassium iodide solution.

$$PbI_2(s) + 2KI (excess) \Longrightarrow K_2[PbI_4] (aq.)$$

The reaction is reversible and on diluting with H₂O, the precipitate reappears.

19. Silver (I)

(a) Dilute hydrochloric acid

With dilute hydrochloric acid (or soluble chlorides), a white precipitate of silver chloride is formed.

$$Ag^+ + Cl^- \longrightarrow AgCl \downarrow White ppt$$

With concentrated hydrochloric acid, precipitation does not occur. After decanting the liquid from over the precipitate, it can be dissolved in concentrated hydrochloric acid, when a dichloroargentate complex is formed.

$$AgCl \downarrow + Cl^{-}(aq.) \rightleftharpoons [AgCl_{2}]^{-}(aq.)$$

On dilution with water, the equilibrium shifts back to the left and the precipitate reappears. Dilute ammonia solution dissolves the precipitate to form the diammineargentate(I) complex ion.

$$AgCl \downarrow + 2NH_3(aq.) \Longrightarrow [Ag(NH_3)_2]^+(aq.) + Cl^-(aq.)$$

Dilute nitric acid or hydrochloric acid neutralizes the excess ammonia and the precipitate reappears because the equilibrium is shifted backwards.

(b) Ammonia solution

Ag⁺ give brown precipitate of silver oxide with NH₃ solution.

The reaction reaches equilibrium, thus the precipitation is incomplete at any stage. The precipitate dissolves in excess of the reagent forming diammineargentate(I) ion.

$$Ag_2O\downarrow + 4NH_3 + H_2O \longrightarrow 2[Ag(NH_3)_2]^+ + 2OH^-$$

Soluble

(c) Potassium iodide solution

Ag⁺ give yellow precipitate of silver iodide on reaction with KI solution.

$$Ag^{+} + I^{-} \longrightarrow AgI^{\downarrow}$$
Yellow ppt

The precipitate is insoluble in dilute or concentrated ammonia but dissolves in KCN and in sodium thiosulphate.

$$AgI^{\downarrow} + 2CN^{-} \longrightarrow [Ag(CN)_{2}]^{-} + I^{-}$$

$$AgI^{\downarrow} + 2S_{2}O_{3}^{2-} \longrightarrow [Ag(S_{2}O_{3})_{2}]^{3-} + I^{-}$$

(d) Disodium hydrogen phosphate solution

With disodium hydrogen phosphate in neutral solution, a yellow precipitate of silver phosphate is obtained.

$$3Ag^{+} + HPO_{4}^{2-} \longrightarrow Ag_{3}PO_{4} \downarrow + H^{+}$$
Yellow ppt

Nitric acid and ammonia solution dissolves the precipitate.

(e) Hydrazine sulphate (saturated)

When hydrazine sulphate is added to a solution of diammineargentate ions, it forms finely divided silver metal and gaseous nitrogen is evolved.

$$4[Ag(NH_3)_2]^+ + H_2N - NH_2.H_2SO_4 \longrightarrow 4Ag\downarrow + N_2\uparrow + 6NH_4^+ + 2NH_3 + SO_4^{2-}$$

Silver mirror

If the vessel in which the reaction is carried out is clean, silver adheres to the glass walls forming an attractive mirror.

20. Mercury (II)

(a) Sodium hydroxide solution

With NaOH, Hg₂ forms a black precipitate of mercury(I) oxide.

$$Hg_2^+ + 2OH^- \longrightarrow Hg_2O\downarrow + H_2O$$
Black ppt

The precipitate is insoluble in excess reagent but dissolves in dilute nitric acid. When the solution is boiled, the colour of precipitate changes to grey owing to the disproportionation, when mercury(II) oxide and mercury metal are formed.

$$Hg_2O\downarrow \longrightarrow HgO\downarrow + Hg\downarrow$$

(b) Ammonia solution

HgCl₂ on treatment with NH₄OH results in giving black precipitate, which is a mixture of mercury metal and basic mercury(II) amido chloride(white precipitate).

$$2Hg_2Cl_2 + 4NH_4OH \longrightarrow HgO.Hg \xrightarrow{NH_2} + 2Hg\downarrow + 3NH_4Cl + 3H_2O$$
Amido mercuric chloride(black)

(c) Potassium iodide solution

Hg₂⁺ give a green precipitate of mercury(I) iodide on reaction with KI solution.

$$Hg_2^+ + 2I^- \longrightarrow Hg_2I_2 \downarrow$$
Green ppt

If excess reagent is added, a disproportionation reaction takes place and a soluble tetraiodomercurate(II) ions and black precipitate of mercury is formed.

$$Hg_2I_2\downarrow + 2I^- \longrightarrow [HgI_4]^{2-} + Hg\downarrow$$
Black ppt

Boiling the mercury(I) iodide precipitate with water, disproportionation again takes place and a mixture of red mercury(II) iodide precipitate and black mercury is formed.

$$Hg_2I_2\downarrow \longrightarrow HgI_2\downarrow + Hg\downarrow$$
Red ppt Black ppt

(d) Potassium chromate solution

Hg₂⁺ give a red crystalline precipitate of mercury(I) chromate with potassium chromate solution in hot.

$$Hg_2^+ + CrO_4^{2-} \longrightarrow Hg_2CrO_4 \downarrow$$
Red ppt

Addition of sodium hydroxide turns the precipitate into black mercury(I) oxide.

$$Hg_2CrO_4\downarrow + 2OH^- \longrightarrow Hg_2O\downarrow + CrO_4^{2-} + H_2O$$
Black ppt

Group II-A Radicals (Pb²⁺, Hg²⁺, Cu²⁺, Bi³⁺, Cd²⁺)

The precipitates of group II-A are insoluble in yellow ammonium sulphide.

21. Mercury (II)

HgS precipitated dissolves in aquaregia forming undissociated HgCl₂.

$$3HgS\downarrow + 6HCl + 2HNO_3 \longrightarrow 3HgCl_2 + 3S\downarrow + 2NO\uparrow + 4H_2O$$

(a) Potassium iodide solution

Potassium iodide when added slowly to the solution of Hg^{2+} , a scarlet red precipitate of mercury(II) iodide is formed.

$$Hg^{2+} + 2I^{-} \longrightarrow HgI_{2} \downarrow$$
Scarlet red ppt

The precipitate dissolves in excess reagent, when colourless tetraiodomecurate(II) ions are formed.

$$HgI_2 + 2I^- \longrightarrow [HgI_4]^{2-} \text{ or } HgI_2 + 2KI \longrightarrow K_2[HgI_4]$$

Soluble

An alkaline solution of potassium tetraiodomercurate(II) serves as a selective and sensitive reagent for ammonium ions (Nessler's reagent).

(b) Tin(II) chloride solution

When SnCl₂ solution is added to a solution of Hg²⁺, a white silky precipitate of mercury(I) chloride(calomel) is obtained.

$$2Hg^{2+} + SnCl_2 \longrightarrow Hg_2Cl_2 \downarrow + Sn^{4+}$$
White silky ppt

If more reagent is added, mercury(I) chloride is further reduced and black precipitate of mercury is formed.

$$Hg_2Cl_2\downarrow + SnCl_2 \longrightarrow 2Hg\downarrow + SnCl_4$$
Black ppt

(c) Cobalt(II) thiocyanate test

When $[Co(SCN)_4]^{2-}$ is added to the solution of Hg^{2+} and walls of the vessel are stirred with a glass rod, a deep-blue crystalline precipitate of cobalt tetrathiocyanatomercurate(II) is formed.

$$Hg^{2+} + Co^{2+} + 4SCN^{-} \longrightarrow Co[Hg(SCN)_{4}] \downarrow$$
Deep-blue ppt

22. Copper (II)

Hot, concentrated nitric acid dissolves copper(II) sulphide, leaving behind sulphur as a white precipitate.

$$3\text{CuS} \downarrow + 8\text{HNO}_3 \longrightarrow 3\text{Cu}^{2+} + 6\text{NO}_3^- + 3\text{S} \downarrow + 2\text{NO} \uparrow + 4\text{H}_2\text{O}$$
White ppt

When boiled for long sulphur is oxidised to H₂SO₄ and a clear blue solution is obtained.

$$S\downarrow + 2HNO_3 \longrightarrow 2H^+ + SO_4^{2-} + 2NO\uparrow$$

(a) Ammonia solution

When ammonia solution is added to solution of Cu²⁺, a blue precipitate of a basic copper sulphate is obtained, which is soluble in excess reagent giving deep—blue colouration of tetraamminecopper(II) sulphate.

$$2Cu^{2+} + SO_4^{2-} + 2NH_3 + 2H_2O \longrightarrow Cu(OH)_2.CuSO_4 \downarrow + 2NH_4^+$$
 Blue ppt
$$Cu(OH)_2.CuSO_4 \downarrow + 8NH_3 \longrightarrow 2[Cu(NH_3)_4]^{2+} + SO_4^{2-} + 2OH^-$$
 Deep- blue colouration

(b) Potassium iodide

Potassium iodide with Cu²⁺ gives a white precipitate of copper(I) iodide but the solution is intensely brown because of the formation of tri–iodide ions (or iodine).

$$2Cu^{2^+} \ + \ 5I^- \ \longrightarrow \ Cu_2I_2 \!\!\! \downarrow \ + \ I_3^-$$
 White ppt

Adding an excess of sodium thiosulphate to the solution, tri-iodide ions are reduced to colourless iodide ions and the white colour of the precipitate becomes visible. The reduction with thiosulphate yields tetrathionate ions.

$$I_3^- + 2S_2O_3^{2-} \longrightarrow 3I^- + S_4O_6^{2-}$$

These reactions are used in quantitative analysis for the iodometric determination of copper.

(c) Potassium hexacyanoferrate(II) solution

 Cu^{2+} ions give chocolate-brown precipitate with $K_4[Fe(CN)_6]$ solution.

$$2Cu^{2+} + K_4[Fe(CN)_6] \xrightarrow{} Cu_2[Fe(CN)_6] \downarrow + 4K^+$$
Chocolate-brown ppt

(d) Potassium thiocyanate solution

With potassium thiocyanate, a black precipitate of copper(II) thiocyanate is obtained.

$$Cu^{2+} + 2SCN^{-} \longrightarrow Cu(SCN)_{2} \downarrow Black ppt$$

The precipitate decomposes slowly to form white copper(I) thiocyanate and thiocyanogen is formed.

$$2Cu(SCN)_2 \downarrow \longrightarrow 2CuSCN \downarrow + (SCN)_2 \uparrow$$
White ppt

Thiocyanogen decomposes rapidly in aqueous solutions.

Copper(II) thiocyanate can be transformed to copper(I) thiocyanate immediately by adding a suitable reducing agent like saturated solution of sulphur dioxide.

$$2Cu(SCN)_2\downarrow + SO_2 + 2H_2O \longrightarrow 2CuSCN\downarrow + 2SCN^- + SO_4^{2-} + 4H^+$$

White ppt

23. Bismuth(III)

Black precipitate of Bi₂S₃ so obtained dissolves in hot dilute nitric acid, leaving behind sulphur in the form of a white precipitate.

$$Bi_2S_3\downarrow + 8H^+ + 2NO_3^- \longrightarrow 2Bi^{3+} + 3S\downarrow + 2NO\uparrow + 4H_2O$$
White ppt

(a) Sodium Hydroxide

With NaOH solution, Bi³⁺ give a white precipitate of bismuth(III) hydroxide.

$$Bi^{3+} + 3OH^{-} \longrightarrow Bi(OH)_{3} \downarrow$$
White ppt

The precipitate is soluble in acids.

$$Bi(OH)_3 \downarrow + 3H^+ \longrightarrow Bi^{3+} + 3H_2O$$

When boiled, the precipitate loses water and turns yellowish-white.

$$Bi(OH)_3 \downarrow \longrightarrow BiO.OH \downarrow + H_2O$$

Yellowish-white ppt

Bi(OH)₃ when reduced by tetrahydroxostannate(II) ions give black precipitate of bismuth metal.

$$2Bi(OH)_3 \downarrow + 3[Sn(OH)_4]^{2-} \longrightarrow 2Bi \downarrow + 3[Sn(OH)_6]^{2-}$$

(b) Potassium iodide

When KI solution is added dropwise to Bi³⁺ solution, a black precipitate of bismuth(III) iodide is obtained.

$$Bi^{3+} + 3I^{-} \longrightarrow BiI_{3} \downarrow$$
Black ppt

The precipitate dissolves readily in excess reagent, when orange-coloured tetraiodobismuthate ions are formed.

$$BiI_3 \downarrow + I^- \Longrightarrow [BiI_4]^-$$

Heating the precipitate of BiI₃ with water, it turns orange due to the formation of bismuthyl iodide.

$$BiI_3 \downarrow + H_2O \longrightarrow BiOI \downarrow + 2H^+ + 2I^-$$

Orange ppt

(c) Water

When a solution of a bismuth salt is poured into a large volume of water, a white precipitate of the corresponding basic salt is produced. This is soluble in dilute mineral acids but is insoluble in alkali hydroxides.

$$Bi^{3+} + NO_3^- + H_2O \longrightarrow BiO(NO_3) \downarrow + 2H^+$$
 $Bi^{3+} + Cl^- + H_2O \longrightarrow BiOCl \downarrow + 2H^+$
White ppt
White ppt

24. Cadmium (II)

Yellow precipitate of CdS dissolves in hot dilute nitric acid giving Cd⁺² ions.

(a) Ammonium Hydroxide

With NH₄OH solution, Cd²⁺ give a white precipitate of cadmium hydroxide.

$$Cd^{2+} + 2NH_4OH \Longrightarrow Cd(OH)_2 \downarrow + 2NH_4^+$$
White ppt

The precipitate dissolves in acid when the equilibrium shifts towards the left. An excess of reagent dissolves the precipitate, when tetramminecadmiate(II)

ions are formed.

$$Cd(OH)_2 \downarrow + 4NH_3 \longrightarrow [Cd(NH_3)_4]^{2+} + 2OH^{-}$$

(b) Potassium cyanide

With KCN solution, Cd²⁺ forms a white precipitate of cadmium cyanide.

$$Cd^{2+} + 2CN^{-} \longrightarrow Cd(CN)_{2} \downarrow$$
White ppt

An excess of reagent dissolves the precipitate due to the formation of tetracyanocadmiate(II) ions.

$$Cd(CN)_2 \downarrow + 2CN^- \longrightarrow [Cd(CN)_4]^{2-}$$

Group II - B Radicals (As³⁺, Sb³⁺, Sn²⁺, Sn⁴⁺)

The precipitates of group II B as As_2S_3 , Sb_2S_3 , SnS and SnS_2 are soluble in yellow ammonium sulphide, $(NH_4)_2S_2$.

25. Arsenic (III)

Yellow precipitate of As₂S₃ is insoluble in concentrated hydrochloric acid but dissolves in hot concentrated nitric acid.

$$3As_2S_3\downarrow + 28HNO_3 + 4H_2O \longrightarrow 6AsO_4^{3-} + 9SO_4^{2-} + 36H^+ + 28NO^+$$

As₂S₃ also dissolves readily in sodium hydroxide and NH₄OH.

$$As_2S_3\downarrow + 6OH^- \longrightarrow AsO_3^{3-} + AsS_3^{3-} + 3H_2O$$

Ammonium sulphide also dissolves the precipitate of As_2S_3 , forming thioarsenite AsS_3^{3-} .

$$As_2S_3 + 3S^{2-} \longrightarrow 2AsS_3^{3-}$$

Yellow ammonium sulphide also dissolves the precipitate forming thioarsenate $2AsS_4^{3-}$.

$$As_2S_3\downarrow + 4S_2^{2-} \longrightarrow 2AsS_4^{3-} + S_3^{2-}$$

(a) Silver nitrate solution

With AgNO₃ solution, AsS₃³ gives a yellow precipitate of silver arsenite in neutral solution.

$$AsS_3^{3-} + 3AgNO_3 \longrightarrow Ag_3AsO_3 \downarrow + 3NO_3^-$$
Yellow ppt

The precipitate is soluble in both nitric acid and ammonia.

(b) Marsh's test

This test is based on the fact that all soluble compounds of arsenic are reduced by 'nascent' hydrogen in acid solution to arsine (AsH₃), a colourless, extremely poisonous gas with a garlic–like odour. If the gas, mixed with hydrogen, is conducted through a heated glass tube, it is decomposed into hydrogen and metallic arsenic, which is deposited as a *brownish–black 'mirror'* just beyond the heated part of the tube. The following reactions take place during the test.

$$Zn + H_2SO_4 \longrightarrow ZnSO_4 + 2[H]$$

Brownish-black mirror

The colourless complex is not too stable. Thus, when hydrogen sulphide gas is passed, cadmium sulphide is precipitated.

$$[Cd(CN)_4]^{2-} + H_2S \longrightarrow CdS \downarrow + 2H^+ + 4CN^-$$

The marked difference in the stabilities of the copper and cadmium tetracyanato complexes serves as the basis for the separation of Cu²⁺ and Cd²⁺ ions.

(c) Potassium iodide

With KI solution, no precipitate is formed (distinction from copper).

26. Antimony (III)

Orange-red precipitate of Sb₂S₃ is soluble in warm concentrated hydrochloric acid, in NaOH solution and in yellow ammonium sulphide (forming a thioantimonate).

$$\begin{array}{l} Sb_2S_3\downarrow + 6HCl \longrightarrow 2Sb^{3+} + 6Cl^- + 3H_2S\uparrow \\ 2Sb_2S_3\downarrow + 4OH^- \longrightarrow 3SbS_2^- + SbO_2^- + 2H_2O \\ Sb_2S_3\downarrow + 4S_2^{2-} \longrightarrow 2SbS_4^{2-} + S_3^{2-} \end{array}$$

(a) Sodium Hydroxide or Ammonia Solution

With NaOH or NH₃ solution, Sb³⁺ forms a white precipitate of antimony(III) oxide Sb₂O₃.*x*H₂O, which is soluble in concentrated solution of caustic alkali forming antimonites.

$$2Sb^{3+} + 6OH^{-} \longrightarrow Sb_{2}O_{3} \downarrow + 3H_{2}O$$
White ppt
$$Sb_{2}O_{3} \downarrow + 2OH^{-} \longrightarrow 2SbO_{2}^{-} + H_{2}O$$

(b) Potassium iodide solution

With KI solution, Sb³⁺ gives a yellow colouration due to the formation of complex salt.

$$Sb^{3+} + 6I^{-} \longrightarrow [SbI_{6}]^{3-}$$
Yellow colouration

(c) Water

When water is poured in a solution of soluble SbCl₃, a white precipitate of antimonyl chloride (SbOCl) is formed, soluble in HCl. With a large excess of water, the hydrated oxide Sb₂O₃.*x*H₂O is produced.

(d) Zinc or Tin

With zinc or tin, Sb³⁺ gives a black precipitate of antimony.

$$2Sb^{3+} + 3Zn \longrightarrow 2Sb \downarrow + 3Zn^{2+}$$
$$2Sb^{3+} + 3Sn \longrightarrow 2Sb \downarrow + 3Sn^{2+}$$

(e) Marsh's test

Marsh's test is carried out exactly as described for arsenic. The stibine (SbH₃), which is evolved, burns with a faintly bluish–green flame. The gas is decomposed by passage through a tube heated to dull redness. A "*lustrous black mirror*" of antimony is formed in a similar manner to the arsenic mirror, but it is deposited on both sides of the heated portion of the tube because of the greater instability of the stibine.

27. Tin (II) And Tin (IV)

SnS (brown precipitate) and SnS₂ (yellow precipitate), both are soluble in concentrated HCl and yellow ammonium sulphide.

$$SnS\downarrow + S_2^{2-} \longrightarrow SnS_3^{2-}$$

 $SnS_2\downarrow + 2S_2^{2-} \longrightarrow SnS_3^{2-} + S_3^{2-}$

(a) Sodium hydroxide solution

With NaOH, Sn²⁺ gives a white precipitate of tin(II) hydroxide, which is soluble in excess alkali.

$$Sn^{2+} + 2OH^{-} \longrightarrow Sn(OH)_{2} \downarrow$$
White ppt
$$Sn(OH)_{2} \downarrow + 2OH^{-} \longrightarrow [Sn(OH)_{4}]^{2-}$$

With NaOH solution, Sn⁴⁺ give a gelatinous white precipitate of tin(IV) hydroxide, which is soluble in excess of precipitant forming hexahydrostannate(IV).

$$\operatorname{Sn}^{4+} + 4\operatorname{OH}^{-} \longrightarrow \operatorname{Sn}(\operatorname{OH})_{4} \downarrow$$
White ppt

$$Sn(OH)_4 \downarrow + 2OH^- \rightleftharpoons [Sn(OH)_6]^{2-}$$

(b) Ammonia solution

With NH₄OH, Sn²⁺ forms a white precipitate of Sn(OH)₂ but the precipitate is insoluble in excess of NH₄OH.

$$Sn^{2+} + 2OH^{-} \longrightarrow Sn(OH)_{2} \downarrow$$
White ppt

With NH₄OH, Sn⁴⁺ gives a white precipitate of Sn(OH)₄, which is insoluble in excess of NH₄OH.

$$Sn^{4+} + 4OH^{-} \longrightarrow Sn(OH)_{4} \downarrow$$
White ppt

(c) Mercury(II) chloride solution

With mercury(II) chloride solution, a white precipitate of mercury(I) chloride (calomel) is formed if a large amount of the reagent is added quickly.

$$Sn^{2+} + 2HgCl_2 \longrightarrow Hg_2Cl_2 \downarrow + Sn^{4+} + 2Cl^-$$

White ppt

If however, tin(II) ions are in excess, the precipitate turns grey, especially on warming, owing to further reduction to mercury metal.

$$Sn^{2+} + Hg_2Cl_2 \downarrow \longrightarrow 2Hg \downarrow + Sn^{4+} + 2Cl^-$$

Grey ppt

Sn⁴⁺ gives no precipitate with mercury(II) chloride solution.

Group III-A (Fe³⁺, Al³⁺, Cr³⁺)

28. Iron (III)

(a) Ammonium sulphide solution

With ammonium sulphide solution, Fe³⁺ gives a black precipitate of iron(II) sulphide and sulphur.

$$2Fe^{3+} + 3S^{2-} \longrightarrow 2FeS \downarrow + S \downarrow$$
Black ppt

In hydrochloric acid, the black iron(II) sulphide precipitate dissolves and the white colour of sulphur becomes visible.

$$FeS \downarrow + 2H^+ \longrightarrow H_2S \uparrow + Fe^{2+}$$

The damp iron(II) sulphide precipitate, when exposed to air, is slowly oxidized to brown iron(III) hydroxide.

$$4\text{FeS}\downarrow + 6\text{H}_2\text{O} + 3\text{O}_2 \longrightarrow 4\text{Fe}(\text{OH})_3\downarrow + 4\text{S}\downarrow$$

From alkaline solutions of ammonium sulphide, black iron(III) sulphide is obtained.

$$2Fe^{3+} + 3S^{2-} \longrightarrow Fe_2S_3 \downarrow$$

On acidification with hydrochloric acid, iron(III) ions are reduced to iron(II) ions and sulphur is formed.

$$Fe_2S_3\downarrow + 4H^+ \longrightarrow 2Fe^{2+} + 2H_2S\uparrow + S\downarrow$$

(b) Sodium hydroxide solution

With sodium hydroxide solution, a reddish-brown precipitate of iron(III) hydroxide, insoluble in excess of the reagent (distinction from aluminium and chromium) is obtained.

$$Fe^{3+} + 3OH^{-} \longrightarrow Fe(OH)_{3} \downarrow$$
Reddish-brown ppt

(c) Potassium hexacyanoferrate(II)

With potassium hexacyanoferrate(II) solution, Fe³⁺ gives intense blue precipitate of iron(III) hexacyanoferrate (Prussian blue).

$$4\text{Fe}^{3+} + 3[\text{Fe}(\text{CN})_6]^{4-} \longrightarrow \text{Fe}_4[\text{Fe}(\text{CN})_6]_3 \downarrow$$
Prussion blue

The precipitate is insoluble in dilute acids but decomposes in concentrated hydrochloric acid. A large excess of the reagent dissolves it partly or entirely, when an intense blue solution is obtained. Sodium hydroxide turns the precipitate red as iron(III) oxide and hexacyanoferrate(II) ions are formed.

$$Fe_4[Fe(CN)_6]_3 \downarrow + 12OH^- \longrightarrow 4Fe(OH)_3 \downarrow + 3[Fe(CN)_6]^{4-}$$

Reddish-brown ppt

Oxalic acid also dissolves Prussian blue forming a blue solution. This process was once used to manufacture blue writing inks.

If iron(III) chloride is added to an excess of potassium hexacyanoferrate(II), a product with the composition KFe[Fe(CN)₆] is formed. This tends to form colloidal solutions ('Soluble Prussian Blue) and cannot be filtered.

(d) Potassium hexacyanoferrate(III)

With potassium hexacyanoferrate(III), a brown colouration is produced, due to the formation of an undissociated complex, iron(III) hexacyanoferrate(III).

$$Fe^{3+} + [Fe(CN)_6]^{3-} \longrightarrow Fe[Fe(CN)_6]$$
Brown colouration

Upon adding hydrogen peroxide or some tin(II) chloride solution, the hexacyanoferrate(III) part of the compound is reduced and Prussian blue is precipitated.

(e) Disodium hydrogen phosphate solution

With disodium hydrogen phosphate solution a yellowish—white precipitate of iron(III) phosphate is formed.

$$Fe^{3+} + HPO_4^{2-} \longrightarrow FePO_4 \downarrow + H^+$$
Yellowish-white ppt

The reaction is reversible, because a strong acid is formed which dissolves the precipitate. It is advisable to add small amounts of sodium acetate, which acts as a buffer.

(f) Sodium acetate solution

With sodium acetate solution, a reddish–brown colouration is obtained, attributed to the formation of a complex ion with the composition [Fe₃(OH)₂(CH₃COO)₆]⁺. The reaction

$$3Fe^{3+} + 6CH_3COO^- + 2H_2O \Longrightarrow [Fe_3(OH)_2(CH_3COO)_6]^+ + 2H^+$$
Reddish-brown colouration

becomes complete only if the strong acid, which is formed, is removed by the addition of an excess of the reagent, which acts as a buffer.

If the solution is diluted and boiled, a reddish-brown precipitate of basic iron(III) acetate is formed.

$$[Fe_3(OH)_2(CH_3COO)_6]^+ + 4H_2O \longrightarrow 3Fe(OH)_2CH_3COO \downarrow + 3CH_3COOH + H^+$$

Reddish-brown ppt

The excess of acetate ion acts as a buffer and the reaction goes to completion.

(g) Ammonium thiocyanate solution

With ammonium thiocyanate solution in slightly acidic medium, a deep—red colouration is produced (difference from iron(II) ions), due to the formation of a non-dissociated iron(III) thiocyanate complex.

$$Fe^{3+} + 3SCN^{-} \longrightarrow Fe(SCN)_{3}$$
 Deep-red colouration

This neutral molecule can be extracted by ether or amyl alcohol.

29. Aluminium (III)

Halides, nitrates, sulphates of Al are water soluble and the aqueous solutions display acidic character owing to hydrolysis.

(a) Sodium hydroxide solution

With sodium hydroxide solution, Al³⁺ gives a white precipitate of aluminium hydroxide.

$$Al^{3+} + 3OH^{-} \longrightarrow Al(OH)_{3} \downarrow$$
White ppt

The precipitate dissolves in excess reagent, forming tetrahydroxoaluminate ions.

$$Al(OH)_3 + OH^- \Longrightarrow [Al(OH)_4]^-$$

Soluble

The reaction is reversible and any reagent, which will reduce the hydroxyl ion concentration sufficiently should cause the reaction to proceed from right to left with the consequent precipitation of aluminium hydroxide. This may be effected with a solution of ammonium chloride (the hydroxyl ion concentration is reduced owing to the formation of the weak base ammonia, which can be readily removed as ammonia gas by heating) or by the addition of acid; in the latter case, a large excess of acid causes the precipitated hydroxide to redissolve.

$$\begin{split} [Al(OH)_4]^- + NH_4^+ &\longrightarrow Al(OH)_3 \downarrow + NH_3 \uparrow + H_2O \\ [Al(OH)_4]^- + H^+ & \rightleftharpoons Al(OH)_3 \downarrow + H_2O \\ Al(OH)_3 + 3H^+ \downarrow & \rightleftharpoons Al^{3+} + 3H_2O \end{split}$$

(b) Disodium hydrogen phosphate solution

With disodium hydrogen phosphate solution, a white gelatinous precipitate of aluminium phosphate is obtained.

$$Al^{3+} + HPO_4^{2-} \Longrightarrow AlPO_4 \downarrow + H^+$$
White ppt

The reaction is reversible; strong acids dissolve the precipitate. However, the precipitate is insoluble in acetic acid (difference from phosphates of alkaline earths, which are soluble). The precipitate can also be dissolved in sodium hydroxide.

(c) Cobalt nitrate solution

Aluminium compounds when heated with sodium carbonate upon charcoal gives a white infusible solid, which glows when hot. If the residue is moistened with a little cobalt nitrate solution and again heated, a blue infusible mass is obtained.

$$2Al_2O_3 + 2Co^{2+} + 4NO_3^- \longrightarrow 2CoAl_2O_4 + 4NO_2^+ + O_2^+$$
Blue infusible mass

Use of excess cobalt nitrate solution should be avoided since this will produce black cobalt oxide (Co_3O_4) upon ignition, which will mask the blue colour.

30. Chromium (III)

(a) Sodium hydroxide solution

With sodium hydroxide solution, a green precipitate of chromium(III) hydroxide is formed.

$$Cr^{3+} + 3OH^{-} \longrightarrow Cr(OH)_{3} \downarrow$$
Green ppt

The reaction is reversible; on the addition of acids the precipitate dissolves. In excess reagent, the precipitate dissolves readily, tetrahydroxochromate(III) ions (or chromite ions) are formed.

$$Cr(OH)_3 + OH^- \Longrightarrow [Cr(OH)_4]^-$$

Soluble

The solution is green. The reaction is reversible; on (slight) acidification and also on boiling chromium(III) hydroxide precipitates again.

(b) Ammonia solution

Bluish–green gelatinous precipitate of Cr(OH)₃ is obtained when treated with ammonia solution but dissolves in excess of ammonia due to the formation of a soluble complex.

$$CrCl_3 + 3NH_4OH \longrightarrow Cr(OH)_3 \downarrow + 3NH_4Cl$$
 $Bluish-green\ ppt$
 $Cr(OH)_3 \downarrow + 6NH_3 \longrightarrow [Cr(NH_3)_6]^{3+} + 3OH^-$

Excess Pink colouration

(c) Chromium pentoxide (chromium peroxide, peroxochromic acid) Test

On acidifying the solution with dilute sulphuric acid, adding few drops of ether or amyl alcohol to the mixture and finally adding some hydrogen peroxide, blue

colouration is formed, which can be extracted into the organic phase by gently shaking. During the reaction, chromium pentoxide is formed.

$$CrO_4^{2-} + 2H^+ + 2H_2O_2 \longrightarrow CrO_5 + 3H_2O$$
Blue colouration
in ether layer

Chromium pentoxide has the following structure: $\begin{bmatrix} O & || & O \\ || & Cr & || \\ O & & O \end{bmatrix}$

Because of the two peroxide groups, the compound is often called chromium peroxide.

The name peroxochromic acid is less appropriate, because the compound does not contain hydrogen at all. In aqueous solution, the blue colour fades rapidly, because chromium pentoxide decomposes to chromium(II) and oxygen.

$$4CrO_5 + 12H^+ \longrightarrow 4Cr^{3+} + 7O_2\uparrow + 6H_2O$$

(d) 1,5-Diphenylcarbazide test

In dilute mineral acid solution, diphenylcarbazide produces a soluble violet colour, which is a characteristic test for chromium. During the reaction, chromate is reduced to chromium(III) and diphenylcarbazone is formed. These reaction products in turn produce a complex with the characteristic colour.

eaction products in turn produce a complex with the characteristic colour.

$$NH-NH-C_6H_5$$
 $N=N-C_6H_5$
 $N=N-C_6H_5$

Diphenylcarbazide

 $N=N-C_6H_5$

Diphenylcarbazone

 $N=N-C_6H_5$
 $N=N-C_6H_5$

Diphenylcarbazone

 $N=N-C_6H_5$

Diphenylcarbazone

 $N=N-C_6H_5$

Diphenylcarbazone-chromium(III)

complex

Group III B (**Zn**²⁺, **Mn**²⁺, **Co**²⁺, **Ni**²⁺)

31. Zinc (II)

(a) Sodium hydroxide solution

With sodium hydroxide solution, a white gelatinous precipitate of zinc hydroxide is formed.

$$Zn^{2+} + 2OH^{-} \longrightarrow Zn(OH)_{2} \downarrow$$
White gelatinous ppt

The precipitate is soluble in acids,

$$Zn(OH)_2 \downarrow + 2H^+ \longrightarrow Zn^{2+} + 2H_2O$$

and also in the excess of the reagent.

$$Zn(OH)_2 \downarrow + 2OH^- \longrightarrow [Zn(OH)_4]^{2-}$$

Zinc hydroxide is thus an amphoteric compound.

(b) Ammonia solution

With ammonia solution, Zn^{2+} forms a white gelatinous precipitate of $Zn(OH)_2$, which is readily soluble in excess reagent.

$$Zn^{2+} + 2NH_3 + 2H_2O \longrightarrow Zn(OH)_2 \downarrow + 2NH_4^+$$
White gelatinous ppt
$$Zn(OH)_2 \downarrow + 4NH_3 \longrightarrow [Zn(NH_3)_4]^{2+} + 2OH^-$$

(c) Disodium hydrogen phosphate solution

With disodium hydrogen phosphate solution, a white precipitate of zinc phosphate is formed.

In the presence of ammonium ions, zinc ammonium phosphate is formed.

$$Zn^{2+} + NH_4^+ + HPO_4^{2-} \Longrightarrow Zn(NH_4)PO_4 \downarrow + H^+$$

Both precipitates are soluble in dilute acids, when the reactions are reversed. Also, both precipitates are soluble in ammonia.

$$Zn_3(PO_4)_2 + 12NH_3 \longrightarrow 3[Zn(NH_3)_4]^{2+} + 2PO_4^{3-}$$

 $Zn(NH_4)PO_4 + 3NH_3 \longrightarrow [Zn(NH_3)_4]^{2+} + HPO_4^{2-}$

(d) Potassium hexacyanoferrate(II)

With potassium hexacyanoferrate(II) solution, a white precipitate of variable composition is obtained. If the reagent is added in some excess, the composition of the precipitate is $K_2Zn_3[Fe(CN)_6]_2$.

$$3Zn^{2+} + 2K^{+} + 2[Fe(CN)_{6}]^{4-} \longrightarrow K_{2}Zn_{3}[Fe(CN)_{6}]_{2} \downarrow$$
White ppt

The precipitate is insoluble in dilute acids but dissolves readily in sodium hydroxide.

 $K_2Zn_3[Fe(CN)_6]_2 + 12OH^- \longrightarrow 2[Fe(CN)_6]^{4-} + 3[Zn(OH)_4]^{2-} + 2K^+$ This reaction can be used to distinguish zinc from aluminium.

(e) Ammonium tetrathiocyanatomercurate(II)

Copper salts alone do not form a precipitate with the ammonium tetrathiocyanatomercurate(II) reagent while zinc ions, if present alone, forms a white precipitate.

$$\operatorname{Zn}^{2+} + [\operatorname{Hg}(\operatorname{SCN})_4]^{2-} \longrightarrow \operatorname{Zn}[\operatorname{Hg}(\operatorname{SCN})_4]^{\downarrow}$$
White ppt

In the presence of copper ions, the copper complex coprecipitates with that of zinc and the violet (or blackish–purple) precipitate consisting of mixed crystals of Zn[Hg(SCN)₄] + Cu[Hg(SCN)₄] is obtained.

(f) Diphenylthiocarbazone(dithiazone) test

Dithiazone forms complexes with a number of metal ions, which can be extracted with chloroform. The zinc complex, formed in neutral, alkaline or acetic acid solutions, is red in colour.

$$Zn^{2+} + 2S = C$$
 $NH-NH$
 C_6H_5
 $NH-N$
 $N=N$
 C_6H_5
 $NH-N$
 $N=N$
 $N=N$
 $N-NH$
 C_6H_5
 C_6H_5

32. Manganese (II)

(a) Sodium hydroxide solution

With sodium hydroxide solution, an initially white precipitate of manganese(II) hydroxide is obtained.

$$Mn^{2+} + 2OH^{-} \longrightarrow Mn(OH)_{2} \downarrow$$
White ppt

The precipitate is insoluble in excess reagent. It rapidly oxidizes on exposure to air, becoming brown, when hydrated manganese dioxide, MnO(OH)₂, is formed.

$$2Mn(OH)_2 \downarrow + O_2 \longrightarrow 2MnO(OH)_2 \downarrow$$
Brown ppt

(b) Ammonia solution

With NH₃ solution, Mn²⁺ gives a white precipitate of manganese(II) hydroxide.

$$Mn^{2+} + 2NH_3 + 2H_2O \Longrightarrow Mn(OH)_2 \downarrow + 2NH_4^+$$

White ppt

The precipitate is soluble in ammonium salts, when the reaction proceeds towards the left.

(c) Disodium hydrogen phosphate solution

With disodium hydrogen phosphate solution, a pink precipitate of manganese ammonium phosphate Mn(NH₄)PO₄.7H₂O, in the presence of ammonia (or ammonium ions) is obtained.

$$Mn^{2+} + NH_3 + HPO_4^{2-} \longrightarrow Mn(NH_4)PO_4 \downarrow$$

Pink ppt

If ammonium salts are absent, pink precipitate manganese(II) phosphate is formed.

$$3Mn^{2+} + 2HPO_4^{2-} \longrightarrow Mn_3(PO_4)_2 \downarrow + 2H^+$$

Pink ppt

Both precipitates are soluble in acids.

(d) Lead dioxide and concentrated nitric acid

On boiling a dilute solution of manganese(II) ions with lead dioxide and a little concentrated nitric acid and allowing the suspended solid containing unattacked lead dioxide to settle, the supernatant liquid acquires a violet—red (or purple) colour due to permanganic acid.

$$5PbO_2 + 2Mn^{2+} + 4H^+ \longrightarrow 2MnO_4^- + 5Pb^{2+} + 2H_2O$$
Purple colour

(e) Sodium bismuthate (NaBiO₃) solution

When sodium bismuthate (NaBiO₃) is added to a cold solution of manganese(II) ions in dilute nitric acid or in dilute sulphuric acid, the mixture stirred and excess reagent filtered off, a violet–red (or purple) solution of permanganate is produced.

$$2Mn^{2+} + 5NaBiO_3 + 14H^+ \longrightarrow 2MnO_4^- + 5Bi^{3+} + 5Na^+ + 7H_2O$$

Purple colour

33. Cobalt (II)

The black precipitate of CoS is insoluble in dilute HCl or acetic acid but hot concentrated HNO₃ or aquaregia dissolves it and white sulphur remains.

$$CoS \downarrow + 2HNO_3 + 6H^+ \longrightarrow 3Co^{2+} + 3S \downarrow + 2NO \uparrow + 4H_2O$$

 $CoS \downarrow + HNO_3 + 3HCl \longrightarrow Co^{2+} + S \downarrow + NOCl \uparrow + 2Cl^- + 2H_2O$

(a) Sodium hydroxide solution

Cobalt(II) nitrate in cold gives a blue basic salt with NaOH solution.

$$Co^{2+} + OH^{-} + NO_{3}^{-} \longrightarrow Co(OH)NO_{3} \downarrow$$
Blue ppt

Upon warming with excess alkali, the basic salt is converted into a pink precipitate of Co(II) hydroxide.

$$Co(OH)NO_3 \downarrow + OH^- \longrightarrow Co(OH)_2 \downarrow + NO_3^-$$

Pink ppt

(b) Ammonia solution

When cobalt(II) nitrate is treated with ammonia solution, a blue basic salt is precipitated.

$$Co^{2+} + NH_3 + H_2O + NO_3^- \longrightarrow Co(OH)NO_3 \downarrow + NH_4^+$$
Blue ppt

The excess of the reagent dissolves the precipitate, when hexamminecobaltate(II) ions are formed.

$$Co(OH)NO_3 \downarrow + 6NH_3 \longrightarrow [Co(NH_3)_6]^{2+} + NO_3^- + OH^-$$

(c) Potassium nitrite solution

To a neutral solution of cobalt(II), add acetic acid, then a freshly prepared saturated solution of potassium nitrite, if the concentration of cobalt(II) in the test solution is high enough, a yellow precipitate of potassium hexanitritocobaltate(II), $K_3[Co(NO_2)_6].3H_2O$ appears immediately. Otherwise, the mixture should either be slightly heated or the wall of the vessel should be rubbed with a glass rod.

$$\text{Co}^{2+}$$
 + 7NO_2^- + 2H^+ + 3K^+ \longrightarrow $K_3[\text{Co}(\text{NO}_2)_6] \downarrow$ + $\text{NO} \uparrow$ + H_2O Yellow ppt

The reaction can also be used for testing for potassium and for nitrite ions. Nickel ions do not react if acetic acid is present.

(d) Ammonium thiocyanate test (Vogel reaction)

On adding ammonium thiocyanate to a neutral or acid solution of cobalt(II), a blue colour appears owing to the formation of tetrathiocyanatocobaltate(II) ions.

$$Co^{2+} + 4SCN^{-} \longrightarrow [Co(SCN)_{4}]^{2-}$$
Blue colour

In amyl alcohol or diethyl ether is added, the free acid $H_2[Co(SCN)_4]$ is formed and dissolved by the organic solvent (distinction from nickel). The test is rendered more sensitive if the solution is acidified with concentrated hydrochloric acid, when the equilibrium

$$2H^+ + [Co(SCN)_4]^{2-} \Longrightarrow H_2[Co(SCN)_4]$$

shifts towards the formation of the free acid, which then can be extracted with amyl alcohol or ether.

(e) KHCO₃ and Br₂ water

On addition of KHCO₃ and Br₂ water to a solution of Co²⁺, the solution turns apple–green in colour.

$$CoCl_2 + 6KHCO_3 \longrightarrow K_4[Co(CO_3)_3] + 2KCl + 3CO_2^{\uparrow} + 3H_2O$$

$$Br_2 + H_2O \longrightarrow 2HBr + [O]$$

$$2K_4[Co(CO_3)_3] + 2KHCO_3 + [O] \longrightarrow 2K_3[Co(CO_3)_3] + 2K_2CO_3 + H_2O$$

$$Apple-green colour$$

(f) Ammonium tetrathiocyanatomercurate(II)

With Co²⁺ ion, ammonium tetrathiocyanatomercurate(II) solution form a deep-blue crystalline precipitate.

$$\text{Co}^{2+} + [\text{Hg}(\text{SCN})_4]^{2-} \xrightarrow{\text{Stirring}} \text{Co}[\text{Hg}(\text{SCN})_4] \downarrow$$
Deep-blue crystalline ppt

34. Nickel (II)

The black precipitate of NiS is insoluble in cold dilute HCl and in acetic acid but dissolves in hot concentrated nitric acid and in aquaregia with the separation of sulphur.

$$NiS \downarrow + 2HNO_3 + 6H^+ \longrightarrow 3Ni^{2+} + 3S \downarrow + 2NO \uparrow + 4H_2O$$

 $NiS \downarrow + HNO_3 + 3HCl \longrightarrow Ni^{2+} + S \downarrow + NOCl \uparrow + 2Cl^- + 2H_2O$

(a) Sodium hydroxide solution

With Ni²⁺, NaOH gives a green precipitate of Ni(OH)₂.

$$Ni^{2+} + 2OH^{-} \longrightarrow Ni(OH)_{2} \downarrow$$
Green ppt

The precipitate is insoluble is excess reagent. The precipitate dissolves in ammonia and excess alkali hydroxide.

$$Ni(OH)_2 \downarrow + 6NH_3 \longrightarrow [Ni(NH_3)_6]^{2+} + 2OH^-$$
Deep-blue colouration
$$Ni(OH)_2 \downarrow + 6NH_4^+ + 4OH^- \longrightarrow [Ni(NH_3)_6]^{2+} + 6H_2O$$
Deep-blue colouration

(b) Ammonia solution

With ammonia solution, Ni²⁺ give a green precipitate of nickel(II) hydroxide.

$$Ni^{2+} + 2NH_3 + 2H_2O \longrightarrow Ni(OH)_2 \downarrow + 2NH_4^+$$
Green ppt

The precipitate dissolves in excess reagent and the solution turns deep blue.

$$Ni(OH)_2 \downarrow + 6NH_3 \longrightarrow [Ni(NH_3)_6]^{2+} + 2OH^-$$

Deep-blue colouration

If ammonium salts are present, no precipitation occurs, but the complex is formed immediately.

(c) Potassium nitrite solution

No precipitate is produced in the presence of acetic acid (difference from cobalt).

(d) Dimethylglyoxime reagent $(C_4H_8O_2N_2)$

Ni²⁺ in presence of ammonia gives a rosy red precipitate of bis(dimethylglyoximato) nickel(II).

$$Ni^{2+} + 2 \qquad CH_3-C=N-OH \qquad \longrightarrow \qquad H_3C-C=N \qquad Ni \qquad N=C-CH_3 \qquad + 2H^+ \qquad O \qquad H_3C-C=N \qquad O \qquad H----O$$

Bis(dimethylglyoximato)nickel(II) Rosy red ppt

Iron(II) (red colouration), bismuth (yellow precipitate) and larger amounts of cobalt (brown colouration) interfere in ammoniacal solution.

(e) KHCO₃, NaOH and Br₂ water

On addition of KHCO₃, NaOH and Br₂ water to solution of Ni²⁺, a black precipitate of Ni₂O₃ is formed.

$$NiCl_2 + 2KHCO_3 \longrightarrow NiCO_3 + 2KCl + H_2O + CO_2 \uparrow$$

 $2NiCO_3 + 4NaOH + [O] \longrightarrow Ni_2O_3 \downarrow + 2Na_2CO_3 + 2H_2O$
Black ppt

Group IV (Ba²⁺, Sr²⁺, Ca²⁺)

35. Barium (II)

(a) Potassium chromate solution

Ba²⁺ ion in solution produces a yellow precipitate with K₂CrO₄ solution.

$$Ba^{2+} + K_2CrO_4 \longrightarrow BaCrO_4 \downarrow + 2K^+$$

Yellow ppt

The precipitate is insoluble in dilute acetic acid but readily soluble in mineral acids. Addition of acid to K_2CrO_4 solution causes the yellow colour of the solution to change to reddish-orange due to formation of $Cr_2O_7^{2-}$.

$$2CrO_4^{2-} + 2H^+ \rightleftharpoons Cr_2O_7^{2-} + H_2O$$

(b) Ammonium sulphate solution

Ba²⁺ ions in solution produces a white precipitate with (NH₄)₂SO₄ solution.

$$Ba^{2+} + (NH_4)_2SO_4 \longrightarrow BaSO_4 \downarrow + 2NH_4^+$$
White ppt

The precipitate is insoluble in dilute acids and in ammonium sulphate solution but appreciably soluble in boiling concentrated H₂SO₄.

$$BaSO_4 \downarrow + H_2SO_4(conc.) \longrightarrow Ba^{2+} + 2HSO_4^{-}$$

(c) Ammonium oxalate solution

 Ba^{2+} ions in solution produces a white precipitate with $(NH_4)_2C_2O_4$ solution.

$$Ba^{2+} + (NH_4)_2C_2O_4 \longrightarrow BaC_2O_4 \downarrow + 2NH_4^+$$
White ppt

The precipitate readily dissolves in hot dilute acetic acid and in mineral acids.

36. Strontium (II)

(a) Ammonium sulphate solution

 Sr^{2+} ions give a white precipitate with $(NH_4)_2SO_4$ solution.

$$Sr^{2+} + (NH_4)_2SO_4 \longrightarrow SrSO_4 \downarrow + 2NH_4^+$$
White ppt

The precipitate is slightly soluble in boiling hydrochloric acid.

(b) Ammonium oxalate solution

 Sr^{2+} ions give a white precipitate with $(NH_4)_2C_2O_4$ solution.

$$Sr^{2+} + (NH_4)_2C_2O_4 \longrightarrow SrC_2O_4 \downarrow + 2NH_4^+$$
White ppt

The precipitate is insoluble in acetic acid but soluble in mineral acids.

37. Calcium (II)

(a) Ammonium oxalate solution

 Ca^{2+} ions give a white precipitate with concentrated $(\text{NH}_4)_2\text{C}_2\text{O}_4$ solution immediately.

$$Ca^{2+} + (NH_4)_2C_2O_4 \longrightarrow CaC_2O_4 \downarrow + 2NH_4^+$$
White ppt

The precipitate is insoluble in acetic acid but soluble in mineral acids.

(b) Potassium hexacyanoferrate(II) solution

With potassium hexacyanoferrate(II) solution, Ca²⁺ ions give a white precipitate of a mixed salt.

The test can be used to distinguish calcium ion from strontium and barium ions.

Group V (NH₄⁺, Na⁺, K⁺, Mg²⁺)

38. Ammonium

(a) Sodium hydroxide solution

All ammonium salts on heating with alkali (NaOH) gives smell of NH₃.

$$NH_4^+ + OH^- \longrightarrow NH_3 \uparrow + H_2O$$

- (i) The gas evolved can be detected by its smell.
- (ii) Gas evolved gives white fumes of NH₄Cl with HCl.

$$NH_3 + HCl \longrightarrow NH_4Cl \uparrow$$
White fumes

(iii) Paper soaked in CuSO₄ solution, becomes deep-blue by NH₃ due to the complex formation.

$$\begin{array}{c} CuSO_4 + 4NH_3 & \longrightarrow & [Cu(NH_3)_4]SO_4 \\ & \text{Deep-blue colouration} \end{array}$$

(iv) Gas can be identified by its ability to turn filter paper moistened with mercury(I) nitrate solution black.

$$2NH_3 + Hg_2^{2+} + NO_3^- \longrightarrow Hg(NH_2)NO_3 \downarrow + Hg \downarrow + NH_4^+$$

$$Mercury(II) \text{ amidonitrate} \qquad Black \text{ ppt}$$

$$White \text{ ppt}$$

(b) Nessler's reagent

With Nessler's reagent (an alkaline solution of potassium tetraiodomercurate(II), ammonium salts form a brown precipitate or brown or yellow colouration is produced depending on the amount of NH⁺₄ ions present in the solution. The precipitate is a basic mercury(II) amido—iodine.

$$NH_4Cl + 2K_2HgI_4 + 3KOH$$
 \longrightarrow $Hg VHg I + 4KI + 2H_2O + 3NaI$

Iodide of Millon's base Brown ppt

This test can detect even traces of NH₃ present in a sample.

(c) Sodium hexanitritocobaltate(III) solution

With NH⁺ ions, sodium hexanitritocobaltate(III) solution gives a yellow precipitate of ammonium hexanitritocobaltate(III).

$$3NH_4^+ + [Co(NO_2)_6]^{3-} \longrightarrow (NH_4)_3[Co(NO_2)_6] \downarrow$$
Yellow ppt

39. Sodium (Na⁺)

(a) Uranyl magnesium acetate solution

Sodium ions with uranyl magnesium acetate solution gives a yellow crystalline precipitate of sodium magnesium uranyl acetate NaMg(UO₂)₃(CH₃COO)₉.9H₂O from concentrated solution. Addition of about one—third volume of alcohol helps the precipitation.

$$Na^{+} + Mg^{2+} + 3UO_{2}^{2+} + 9CH_{3}CO_{2}^{-} \longrightarrow NaMg(UO_{2})_{3}(CH_{3}CO_{2})_{9}$$

$$Yellow ppt$$

(b) Uranyl zinc acetate reagent

Na⁺ ions on reaction with uranyl zinc acetate solution gives a yellow crystalline precipitate of sodium zinc uranyl acetate, NaZn(UO₂)₃(CH₃COO)₉.9H₂O.

$$Na^+ + Zn^{2+} + 3UO_2^{2+} + 9CH_3CO_2^- \longrightarrow NaZn(UO_2)_3(CH_3CO_2)_9.9H_2O$$

Yellow ppt

40. Potassium (K⁺)

(a) Sodium hexanitritocobaltate(III) solution

Potassium salts gives yellow precipitate with sodium hexanitritocobaltate(III) solution.

$$Na_3[Co(NO_2)_6] + 3KC1 \longrightarrow K_3[Co(NO_2)_6] \downarrow + 3NaC1$$

Yellow ppt

(b) Hexachloroplatinic(IV) acid reagent

Yellow precipitate of potassium hexachloroplatinate(IV) is obtained by the reaction of K^+ ions with $H_2[PtCl_6]$.

$$2K^{+} + [PtCl_{6}]^{2-} \longrightarrow K_{2}[PtCl_{6}] \downarrow$$
Yellow ppt

41. Magnesium (II)

(a) Ammonia solution

Mg²⁺ gives white gelatinous precipitate of magnesium hydroxide on reaction with ammonium hydroxide,

$$Mg^{2+} + 2NH_4OH \longrightarrow Mg(OH)_2 \downarrow + 2NH_4^+$$
White ppt

The precipitate obtained is sparingly soluble in water but readily soluble in ammonium salts.

(b) Ammonium carbonate solution

 Mg^{2+} reacts with ammonium carbonate solution in the absence of NH⁺₄ salts to give a white precipitate of basic magnesium carbonate.

$$5Mg^{2+} + 6CO_3^{2-} + 7H_2O \longrightarrow 2MgCO_3.Mg(OH)_2.5H_2O \downarrow + 2HCO_3^-$$
White ppt

In the presence of NH_4^+ salts no precipitation occurs, because the equilibrium

$$NH_4^+ + CO_3^{2-} \Longrightarrow NH_3 + HCO_3^-$$

is shifted towards the formation of HCO₃ ions.

(c) Disodium hydrogen phosphate solution

With disodium hydrogen phosphate solution, Mg²⁺ gives a white crystalline precipitate magnesium ammonium phosphate in the absence of NH₄Cl and ammonia solution.

$$Mg^{2+} + NH_3 + HPO_4^{2-} \longrightarrow Mg(NH_4)PO_4 \downarrow$$
White ppt

A white flocculent precipitate of magnesium hydrogen phosphate (MgHPO₄) is obtained in neutral solutions.

$$Mg^{2+} + HPO_4^{2-} \longrightarrow MgHPO_4 \downarrow$$
White ppt

42. Iron (II)

(a) Sodium hydroxide solution

With sodium hydroxide, Fe²⁺ forms a white precipitate of iron(II) hydroxide, [Fe(OH)₂] in the complete absence of air, insoluble in excess but soluble in acids. Upon exposure to air, iron(II) hydroxide is rapidly oxidized, yielding ultimately reddish-brown iron(III) hydroxide. Under ordinary conditions, it appears as a dirty-green precipitate. The addition of hydrogen peroxide to Fe(OH)₂ immediately oxidizes it to iron(III) hydroxide.

$$Fe^{2+} + 2OH^{-} \longrightarrow Fe(OH)_{2} \downarrow$$
White ppt
$$4Fe(OH)_{2} + 2H_{2}O + O_{2} \longrightarrow 4Fe(OH)_{3} \downarrow$$

$$Reddish-brown ppt$$

$$2Fe(OH)_{2} + H_{2}O_{2} \longrightarrow 2Fe(OH)_{3} \downarrow$$

$$Reddish-brown ppt$$

(b) Potassium hexacyanoferrate(II) solution

With potassium hexacyanoferrate(II) solution, Fe²⁺ forms a white precipitate of potassium iron(II) hexacyanoferrate(II) in the absence of air.

$$Fe^{2+} + 2K^{+} + [Fe(CN)_{6}]^{4-} \longrightarrow K_{2}Fe[Fe(CN)_{6}] \downarrow$$
White ppt

Under ordinary atmospheric conditions, a pale-blue precipitate is obtained.

(c) Potassium hexacyanoferrate(III) solution

With potassium hexacyanoferrate(III) solution, a dark-blue precipitate is obtained. First hexacyanoferrate(III) ions oxidise iron(II) to iron(III) and itself get reduced to hexacyanoferrate(II).

$$Fe^{2+} + [Fe(CN)_6]^{3-} \longrightarrow Fe^{3+} + [Fe(CN)_6]^{4-}$$

Fe³⁺ and [Fe(CN)₆]⁴⁻ ions combine to give a precipitate called Turnbull's blue, which is same as Prussian blue. Earlier Turnbull's blue and Prussian blue were thought to be two different complexes.

$$4Fe^{3+} + 3[Fe(CN)_6]^{4-} \longrightarrow Fe_4[Fe(CN)_6]_3 \downarrow$$
Prussion blue

The identical composition and structure of Turnbull's blue and Prussian blue has recently been proved by Mossbauer spectroscopy.

(d) Ammonium thiocyanate solution

With ammonium thiocyanate solution, no colouration is obtained with pure iron(II) salts (distinction from(III) ions).

(e) Dimethylglyoxime reagent

With dimethylglyoxime reagent soluble red iron(II) dimethyl glyoxime is obtained in ammonical solution. Iron(III) salts give no colouration, but nickel, cobalt and large quantities of copper salts interfere and must be absent.

Some Important Observations During Qualitative Analysis

Residue and its Colour after Heating

S. No.	RESIDUE	COLOUR
(i)	ZnO	Yellow (hot) and white (cold)
(ii)	PbO	Reddish brown (hot) and yellow (cold)
(iii)	HgO, Pb ₃ O ₄	Black (hot) and red (cold)
(iv)	Fe ₂ O ₃	Black (hot) and red brown (cold)

Flame Test

Compounds of certain metals are volatilised in a non-luminous Bunsen burner flame and impart characteristic colours to the flame. The chlorides are among the most volatile compounds and these are prepared in *situ* by mixing the compound with a little concentrated hydrochloric acid before carrying out the

test. A thin platinum wire about 5 cm long and 0.03–0.05 mm diameter, fused into the end of a glass rod (which serves as a handle) is employed for the flame test. This is first thoroughly cleaned by dipping it into concentrated hydrochloric acid contained in a watch glass and then heating it in the fusion zone of the Bunsen burner flame; the wire is clean when it imparts no colour to the flame. The wire is dipped into concentrated hydrochloric acid on a watch glass, then into a little of the substance being investigated so that a little amount of it adheres to the wire. It is then introduced into the lower oxidizing zone of the flame and the colour imparted to the flame is observed. The colours imparted to the flame by salts of different metals are shown in table given below.

Metal ion	Colour observed
Sodium	Persistent golden-yellow flame
Potassium	Violet (lilac) flame
Lithium	Carmine–red flame
Calcium	Brick-red flame
Strontium	Crimson flame
Barium	Yellowish-green(apple green) flame
Borates, copper	Green flame
Lead, arsenic, antimony, bismuth	Blue flame (wire slowly corroded)

Borax Bead Test

Platinum wire is also used for the borax bead test. The free end of the platinum wire is coiled into a small loop through which an ordinary matchstick will barely pass. The loop is heated in the Bunsen burner flame until it is red hot and then quickly dipped into powdered borax, Na₂B₄O₇.10H₂O. The adhering solid is held in the hottest part of the flame; the salt swells up as it loses its water of crystallization and shrinks upon the loop forming a colourless, transparent, glass–like bead consisting of a mixture of sodium metaborate and boric anhydride.

$$Na_2B_4O_7.10H_2O \xrightarrow{-10H_2O} Na_2B_4O_7 \longrightarrow 2NaBO_2 + B_2O_3$$

The bead is dipped into the finely powdered substance so that a minute amount of it adheres to the bead. It is important to employ a minute amount of the substance as otherwise the bead will become dark and opaque in the subsequent heating. The bead and adhering substance are heated in the lower oxidizing flame, allowed to cool and then the colour is observed.

Characteristic coloured beads are produced with salts of copper, iron, chromium, manganese, cobalt and nickel. The coloured borax beads are due to the formation of coloured borates.

CuO +
$$B_2O_3$$
 \longrightarrow Cu(BO₂)₂ (copper(II) metaborate)
Blue colour in cold
FeO + B_2O_3 \longrightarrow Fe(BO₂)₂ (iron(II) metaborate)
Yellow colour in cold

	Oxidizing flame	
Metal	Hot	Cold
Copper	Green	Blue
Iron	Yellow-brown	Yellow
Chromium	Yellow	Green
Manganese	Violet (amethyst)	Amethyst
Cobalt	Blue	Blue
Nickel	Violet	Reddish-brown

Coloured Compounds

In dry state:

Colour	Compounds/ions
DI I	(a) Sulphides: Ag ₂ S, PbS, HgS, CuS, NiS, CoS
Black	(b) Oxides: FeO, Fe ₃ O ₄ , CuO, Ag ₂ O, Ni ₂ O ₃ , Co ₂ O ₃ , MnO
	Dark: Fe ₂ O ₃ , PbO ₂ , Cu ₂ O, CdO, SnS, Fe(OH) ₃ , SnS,
Brown	Ag ₂ O _, Bi ₂ S ₃ , CuCrO ₄
	Light: MnCO ₃

Red	Pb ₃ O ₄ (red lead) HgI ₂ , HgO, Cu ₂ O	
Pink	Co(II) salt, Mn(II) salt	
Orange	Sb_2S_3 , Sb_2S_5 , Dichromate $(Cr_2O_7^{2-})$	
Green	Dark: Cr(III) salts	
Green	Light: Ni(II) salts, Mohr's salt, Fe(II) salts, CuCl ₂	
Yellow	Fe(III) salts; Chromate (CrO_4^{2-}) , Ferrocyanide $[Fe(CN)_6]^{4-}$,	
1 CHOW	CdS, As ₂ S ₃ , PbI ₂ , AgI, SnS ₂ , NiCl ₂ , hot ZnO.	
Blue	Blue Cu(II) salts (Hydrated), anhydrous Co(II) salt	
Purple Permanganate (MnO ₄), Solid Iodine		
Buff Colour MnS		

In solution:

Colour	Ions
Pink	$Co^{2+}(II), Mn^{2+}(II)$
Orange	dichromate ion (Cr ₂ O ₇ ²⁻)
Green	Cr(III), Ni(II), Fe(II) In decreasing order of intensity of colour
Yellow	Chromate (CrO ₄ ²⁻), Fe(III), Ferrocyanide [Fe(CN) ₆] ⁴⁻
Blue	Cu(II)
Purple	MnO_4^-

Colour of Gases

Coloured gases	Colourless gases
1 Daddish brown, Dr. and NO	H ₂ , CO, CO ₂ , N ₂ , N ₂ O, NO, NH ₃ , SO ₂ ,
1. Reddish brown: Br ₂ and NO ₂	HCl, H2O, O2, H2S, PH3
2. White: SO ₃	
3. Greenish & yellow: F ₂ and Cl ₂	
4. Violet (Purple): I ₂	
5. Light Blue: O ₃	

Fundamental Solved Examples

Example 1.

- (i) A black coloured compound (B) is formed on passing hydrogen sulphide through the solution of a compound (A) in NH₄OH.
- (ii) (B) on treatment with hydrochloric acid and KClO₃ gives (A).
- (iii) (A) on treatment with potassium cyanide gives a buff coloured precipitate which dissolves in excess of this reagent forming a compound (C).
- (iv) The compound (C) is changed into a compound (D) when its aqueous solution is boiled.
- (v) The solution of (A) was treated with excess of sodium bicarbonate and then with bromine water. On cooling and shaking for sometime, a green colour of compound (E) is formed. No change is observed on heating.

Identify (A) to (E) and give chemical equations for reactions at steps (i) to (v).

Solution:

The compound (A) is a cobalt(II) salt (CoCl₂).

- (i) $CoCl_2 + 2NH_4OH + H_2S \longrightarrow CoS \downarrow + 2NH_4Cl + 2H_2O$ (A) Black (B)
- (ii) $CoS \downarrow + 2HCl + O (from KClO_3) \longrightarrow CoCl_2 + H_2O + S$
- (iii) $CoCl_2 + 2KCN \longrightarrow Co(CN)_2 \downarrow + 2KCl$ Buff coloured ppt
- (iv) $2K_4[Co(CN)_6] + H_2O + O \text{ (from air)} \longrightarrow 2K_3[Co(CN)_6] + 2KOH$ (D)
- (v) $CoCl_2 + 6NaHCO_3 \longrightarrow Na_4[Co(CO_3)_3] + 2NaCl + 3CO_2 + 3H_2O$ $2Na_4[Co(CO_3)_3] + H_2O + O \longrightarrow 2Na_3[Co(CO_3)_3] + 2NaOH$ (E)

Example 2:

A hydrated metallic salt (A), light green in colour, on careful heating gives a white anhydrous residue (B). (B) is soluble in water and its aqueous solution reacts with NO to give a dark brown compound (C). (B) gives a brown residue (D) and a mixture of two gases (E) and (F) upon strong heating. The gases when

passed through an acidified $BaCl_2$ solution gave a white precipitate. Identify (A), (B), (C), (D), (E) and (F).

Solution:

FeSO₄.7H₂O
$$\stackrel{\triangle}{\longrightarrow}$$
 FeSO₄ + 7H₂O↑
(A) (B)

FeSO₄(aq) + NO \longrightarrow FeSO₄.NO
(C)

2FeSO₄ $\stackrel{\triangle}{\longrightarrow}$ Fe₂O₃ + SO₂↑ + SO₃↑
(D) (E) (F)

SO₃ + H₂O + BaCl₂ \longrightarrow BaSO₄↓ + 2HCl
White ppt

Example 3:

When a crystalline compound (X) is heated with K₂Cr₂O₇ and concentrated H₂SO₄, a reddish-brown gas (A) is evolved. On passing (A) into caustic soda, a yellow coloured solution of (B) is obtained. Neutralizing the solution of (B) with acetic acid and on subsequent addition of lead acetate, a yellow precipitate of (C) is obtained. When (X) is heated with NaOH, a colourless gas is evolved and on passing this gas into K₂HgI₄ solution, a reddish-brown precipitate (D) is formed. Identify (A), (B), (C), (D) and (X). Write the equation of reactions involved.

Solution:

The given information in the question infers that compound (X) should be NH₄Cl.

$$K_2Cr_2O_7 + 2H_2SO_4 \longrightarrow 2KHSO_4 + 2CrO_3 + H_2O$$
 $NH_4Cl + H_2SO_4 \longrightarrow NH_4HSO_4 + HCl$
 $CrO_3 + 2HCl \longrightarrow CrO_2Cl_2 \uparrow + H_2O$
 (A)
 $Reddish$ —brown gas
 $CrO_2Cl_2 + 4NaOH \longrightarrow Na_2CrO_4 + 2NaCl + 2H_2O$
 (B)
 $Yellow coloured solution$
 $Na_2CrO_4 + (CH_3COO)_2Pb \longrightarrow PbCrO_4 \downarrow + 2CH_3COONa$
 (C) Yellow ppt

$$NH_4Cl + NaOH \longrightarrow NaCl + NH_3 + H_2O$$

$$Colourless gas$$

$$NH_3 + 2K_2[HgI_4] + H_2O \longrightarrow Hg$$

$$NH_2 I + 4KI + 3HI$$

Example 4:

A white substance (A) reacts with dilute H₂SO₄ to produce a colourless gas (B) and a colourless solution (C). The reaction between (B) and acidified K₂Cr₂O₇ solution produces a green solution and a slightly coloured precipitate (D). The substance (D) burns in air to produce a gas (E), which reacts with (B) to yield (D) and a colourless liquid. Anhydrous copper sulphate is turned blue on addition of this colourless liquid. Addition of aqueous NH₃ or NaOH to (C) produces first a white precipitate, which dissolves in the excess of respective reagent to produce a clear solution in each case. Identify (A), (B), (C), (D), (E) and write the equations of the reactions involved.

Solution:

$$ZnSO_4 + 2NH_4OH \longrightarrow Zn(OH)_2 \downarrow + (NH_4)_2SO_4$$

 $Zn(OH)_2 \downarrow + (NH_4)_2SO_4 + 2NH_4OH \longrightarrow [Zn(NH_3)_4]SO_4 + 4H_2O$
Soluble complex
(Clear solution)

Example 5:

- (i) A powdered substance (A) on treatment with fusion mixture gives a green coloured compound (B).
- (ii) The solution of (B) in boiling water on acidification with dilute H₂SO₄ gives a pink coloured compound (C).
- (iii) The aqueous solution of (A) on treatment with excess of NaOH and bromine water gives a compound (D).
- (iv) A solution of (D) in concentrated HNO₃ on treatment with lead peroxide at boiling temperature produced a compound (E), which was of the same colour as that of (C).
- (v) A solution of (A) in dilute HCl on treatment with a solution of barium chloride gave a white precipitate of compound (F), which was insoluble in concentrated HNO₃ and concentrated HCl.

Identify (A) to (F) and give balanced chemical equations for the reactions at steps (i) to (v).

Solution:

The compound (A) is a sulphate as its solution in dilute HCl on treatment with barium chloride solution gives a white precipitate of barium sulphate (F), which is insoluble in concentrated HNO₃ and concentrated HCl.

Solution of (A) in dilute
$$HCl + BaCl_2 \longrightarrow BaSO_4$$
 (White ppt.)

(F)

Insoluble in concentrated HNO_3 and concentrated HCl

From reactions (i) and (ii), it is clear that the compound (A) is manganese sulphate.

(i)
$$MnSO_4 + 2Na_2CO_3 + 2KNO_3 \longrightarrow Na_2MnO_4 + 2KNO_2 + Na_2SO_4 + 2CO_2$$
(A) (B) Green coloured compound

(ii)
$$3Na_2MnO_4 + 2H_2SO_4 \longrightarrow 2NaMnO_4 + 2Na_2SO_4 + MnO_2 + 2H_2O$$
(B)
(C)
(B)
(B)
(C)

Pink coloured compound

(iii)
$$MnSO_4 + 4NaOH + Br_2 \longrightarrow MnO_2 + Na_2SO_4 + 2NaBr + 2H_2O$$
(D)

(iv)
$$2MnO_2 + 10HNO_3 + 5PbO_2 \longrightarrow 2HMnO_4 + 5Pb(NO_3)_2 + 4H_2O + O_2$$
(E)

Pink coloured solution

(v)
$$MnSO_4 + BaCl_2 \longrightarrow BaSO_4 \downarrow + MnCl_2$$
(A) (F) White ppt

Example 6:

Two ores of the same metal (M) are (A_1) and (A_2) .

$$(A_1) \xrightarrow{Calcination} Black ppt.(C) + CO_2 + H_2O$$

$$(A_1) \xrightarrow{KI} I_2 + ppt.(D)$$

$$(A_2) \xrightarrow{\text{Roasting}} gas(G) + metal(M)$$

$$(G) + K_2Cr_2O_7 \xrightarrow{\text{acidified}} Green solution$$

Identify (M) , (A_1) , (A_2) , (C) , (D) and (G) .

Solution:

$$\begin{array}{cccc} CuCO_3 \cdot Cu(OH)_2 & \xrightarrow{Calcination} & 2CuO \downarrow & + & CO_2 \uparrow & + & H_2O \\ & & & & Black (C) & & & \end{array}$$

$$CuCO_3 \cdot Cu(OH)_2 + 4HC1 \longrightarrow 2CuCl_2 + CO_2 \uparrow + 3H_2O$$

$$2CuCl_2 + 4KI \longrightarrow Cu_2I_2 \downarrow + 4KCl + I_2$$

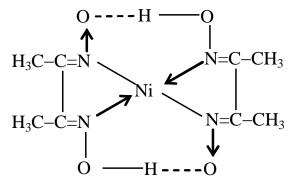

$$3SO_2 + K_2Cr_2O_7 + H_2SO_4 \longrightarrow K_2SO_4 + Cr_2(SO_4)_3 + 4H_2O$$
(G) (green)

Example 7.

Nickel chloride is mixed with dimethyl glyoxime. When ammonium hydroxide is slowly added, a shining red precipitate is formed.

- (a) Give the structure of complex showing hydrogen bonds.
- (b) Give the charge and the state of hybridization of the central metal ion.
- (c) Predict the magnetic behaviour of the complex.

Solution:

- (a) The charge on Ni in the complex is +2.
- (b) The hybridisation of Ni in the complex is dsp^2 and its structure is square planar.
- (c) The complex is diamagnetic.

Bis(dimethylglyoximato)nickel(II)

Example 8:

$$Na_2CO_3 \xrightarrow{\text{SO}_2} (A) \xrightarrow{Na_2CO_3} (B) \xrightarrow{\text{elements}} (C) \xrightarrow{I_2} (D).$$

Find (A), (B), (C) and (D). Give oxidation state of sulphur in each compound.

Solution:

(A): NaHSO₃ (B): Na₂SO₃

(C): $Na_2S_2O_3$ (D): $Na_2S_4O_6$

Oxidation state of sulphur in (A) is +4, in (B) is also +4, in (C) is +2 and in (D) is +5/2.

Example 9:

A mixture consisting of A (yellow solid) and B (colourless solid) gives lilac colour in flame.

- (a) Mixture gives black precipitate C on passing H₂S gas in acidic medium.
- (b) C is soluble in aqua-regia and on adding SnCl₂, it gives white precipitate, which finally turns to greyish black precipitate D.

The white precipitate on treatment with NH₄OH gives a brown precipitate.

- (i) The sodium carbonate extract of the salt A with CCl₄/FeCl₃ gives a violet layer.
- (ii) The sodium carbonate extract of the salt A gives yellow precipitate in AgNO₃ solution, which is insoluble in NH₃. Identify A and B and the precipitate C and D.

Solution:

(A): KI₃ (B): HgCl₂ (C): HgS (D): Hg
(a) HgCl₂ + H₂S
$$\longrightarrow$$
 HgS + 2HCl
(B) Black ppt
(C)
(b) 3HgS + 6HCl + 2HNO₃ \longrightarrow 3HgCl₂ + 2NO + 3S + 4H₂O
2HgCl₂ + SnCl₂ \longrightarrow Hg₂Cl₂ \downarrow + SnCl₄
White ppt
Hg₂Cl₂ + SnCl₂ \longrightarrow 2Hg \downarrow + SnCl₄
Grey ppt
Hg₂Cl₂ + 2NH₄OH \longrightarrow Hg + Hg(NH₂)Cl + NH₄Cl
Brown
(i) Γ + FeCl₃ \longrightarrow Γ ₂ $\xrightarrow{\infty_4}$ CCl₄ - Γ ₂
(From soda extract)
(ii) Γ + AgNO₃ \longrightarrow AgI \downarrow
(From soda extract)
Yellow ppt
(Insoluble in NH₃)
KI₃ + HgCl₂ \longrightarrow lilac colour in flame.
Yellow White
(A) (B)

Example 10.

An aqueous solution containing one mole of HgI₂ and two mole of NaI is orange in colour. On addition of excess NaI the solution becomes colourless. The orange colour reappears on subsequent addition of NaOCl. Explain with equations.

Solution:

A solution containing one mole of HgI₂ and two mole of NaI is orange in colour due to the partial solubility of HgI₂. On addition of excess of NaI, the colourless complex Na₂HgI₄ is formed.

$$2NaI + HgI_2 \longrightarrow Na_2HgI_4$$

Excess

The Na₂HgI₄ on addition of NaOCl, oxidises as:

$$3Na_2HgI_4 + 2NaOCl + 2H_2O \longrightarrow 3HgI_2 + 2NaCl + 4NaOH + NaI_3$$

Thus, colour of partially soluble HgI_2 is restored.

Example 11.

Two solid laboratory reagents (A) and (B) give the following reactions:

Compound (A)

- (i) On strongly heating it gives two oxides of sulphur.
- (ii) On adding aqueous NaOH solution to its aqueous solution, a dirty green precipitate is obtained, which starts turning brown on exposure to air.

Compound (B)

- (iii) It imparts green colour to the flame.
- (iv) Its solution does not give a precipitate on passing H₂S.
- (v) When it is heated with solid K₂Cr₂O₇ and concentrated H₂SO₄, a red gas is evolved. Gas when passed in an aqueous solution of NaOH, turns it yellow.

What are (A) and (B)?

Solution:

Compound (A) is ferrous sulphate, which give SO₂ and SO₃ on heating

$$2FeSO_4 \longrightarrow Fe_2O_3 + SO_2 \uparrow + SO_3 \uparrow$$
Ferrous sulphate

Ferrous sulphate gives dirty green precipitate of Fe(OH)₂ with aqueous NaOH.

$$FeSO_4 + 2NaOH \longrightarrow Fe(OH)_2 \downarrow + Na_2SO_4$$

Fe(OH)₂ turns brown on oxidation, when exposed to atmosphere.

$$Fe(OH)_2 + \frac{1}{2}H_2O + \frac{1}{4}O_2 \longrightarrow Fe(OH)_3$$

Brown

Compound (**B**) is BaCl₂ which imparts green colour to flame and does not give any precipitate with H₂S.

BaCl₂ forms chromyl chloride, when treated with K₂Cr₂O₇ and concentrated H₂SO₄.

$$2BaCl_2 + K_2Cr_2O_7 + 3H_2SO_4 \longrightarrow K_2SO_4 + 2BaSO_4 + 2CrO_2Cl_2 + 3H_2O \\ \text{Chromyl chloride (red gas)}$$

Chromyl chloride forms, yellow coloured Na₂CrO₄ with aqueous NaOH.

$$CrO_2Cl_2 + 4NaOH \longrightarrow Na_2CrO_4 + 2NaCl + 2H_2O$$
Yellow (sodium chromate)

Example 12.

A light green crystalline (X) compound responds to the following test:

- (i) Its aqueous solution gives a brown precipitate or colouration with alkaline $K_2[HgI_4]$ solution.
- (ii) Its aqueous solution gives a blue colour with $K_3[Fe(CN)_6]$ solution.
- (iii) Its solution in hydrochloric acid gives a white precipitate with BaCl₂ solution. Identify the ions present and suggest the formula of the compound, (X).

Solution:

- (i) K₂HgI₄ is called Nessler's reagent. it is specially used to test the presence of NH₄⁺; giving brown precipitate. Hence, compound contains NH₄⁺.
- (ii) With $K_3[Fe(CN)_6]$, only Fe^{2+} ion gives blue colour called turnbull's/prussion blue.
- (iii) BaCl₂ gives white precipitate with so₄²⁻ ions. Hence, compound (X) would be Mohr' salt. FeSO₄.(NH₄)₂SO₄.6H₂O which contains all the three ions.

Example 13.

An unknown solid mixture contains one or two of the following: CaCO₃, BaCl₂, AgNO₃, Na₂SO₄, ZnSO₄ and NaOH. The mixture is completely soluble in water and the solution gives pink colour with phenolphthalein. When dilute hydrochloric acid is gradually added to above solution, a precipitate is formed, which dissolves with further addition of the acid. What is/are present in the solid mixture?

Solution:

- (i) Mixture gives pink colour with phenolphthalein, hence it should contain NaOH.
- (ii) Aqueous solution gives precipitate with dilute HCl, which dissolves in excess HCl. It means that compound is zinc salt.

Thus, the solid mixture should be of NaOH and ZnSO₄.

Reactions involved are:

$$ZnSO_4 + 4NaOH \longrightarrow Na_2ZnO_2 + Na_2SO_4 + 2H_2O$$
Sodium zincate

$$Na_2ZnO_2 + 2HC1 \longrightarrow 2NaC1 + Zn(OH)_2 \downarrow$$
White ppt

$$Zn(OH)_2 + 2HC1 \longrightarrow ZnCl_2 + 2H_2O$$

Example 14.

A colourless solid (A) liberates a brown gas (B) on acidification, a colourless alkaline gas (C) on treatment with NaOH and a colourless non-reactive gas (D) on heating. If heating of the solid is continued, it completely disappears. Identify the compounds (A) to (D).

Solution:

Alkaline gas (C) with NaOH indicate that solid should be ammonium salt. Heating the salt, a colourless non-reactive gas (D) is formed. The gas (D) may be nitrogen. The compound may thus be NH₄NO₂. Reactions involved are as follows:

(i)
$$NH_4NO_2 \xrightarrow{HCI} NH_4CI + HNO_2$$

 (A)
 $2HNO_2 \longrightarrow H_2O + 2NO + [O]$
 $2NO + 2[O] \longrightarrow 2NO_2 \uparrow$
(B) Brown gas
(ii) $NH_4NO_2 + NaOH \longrightarrow NaNO_2 + H_2O + NH_3 \uparrow$
(C)

(iii)
$$NH_4NO_2$$
 $\xrightarrow{\text{Heat}}$ $N_2\uparrow + 2H_2O\uparrow$ (D)

Example 15.

An aqueous solution of gas (X) gives a following reactions:

- (i) It decolourizes an acidified $K_2Cr_2O_7$ solution.
- (ii) On boiling it with H₂O₂, cooling it and then adding an aqueous solution of BaCl₂ a precipitate insoluble in dil. HCl is obtained.
- (iii) On passing H_2S in the solution, a white turbidity is obtained. Identify the compound (X).

Solution:

The reactions given in (i), (ii) and (iii) may be explained if we consider the gas (X) to be SO₂.

- (i) $K_2Cr_2O_7 + 4H_2SO_4 \longrightarrow K_2SO_4 + Cr_2(SO_4)_3 + 4H_2O + 3[O]$ $H_2O + SO_2 + [O] \longrightarrow H_2SO_4$
- (ii) $H_2O_2 + SO_2 \longrightarrow H_2SO_4$ $H_2SO_4 + BaCl_2 \longrightarrow BaSO_4 + 2HCl$ White ppt

(iii)
$$2H_2S + SO_2 \longrightarrow 2H_2O + 3S$$
Colloidal sulphur (white turbidity)

Example 16.

An aqueous solution of gas (X) shows the following reactions:

- (i) It turns red litmus blue.
- (ii) When added in excess to a copper sulphate solution, a deep blue colour is obtained.
- (iii) On addition of FeCl₃ solution, a brown precipitate, soluble in dilute HNO₃ is obtained. Identify the compound (X).

Solution:

Gas (X) is soluble in water forming basic solution because it turns red litmus blue. Hence, the gas may be NH₃.

$$NH_3 + H_2O \longrightarrow NH_4OH$$

$$CuSO_4 + 4NH_4OH \longrightarrow [Cu(NH_3)_4]SO_4 + 4H_2O$$

$$(Tetra-amine cupric sulphate)$$

$$Deep blue complex$$

$$Ferric chloride gives brown precipitate of Fe(OH)_3.$$

$$FeCl_3 + 3NH_4OH \longrightarrow Fe(OH)_3 + 3NH_4Cl$$

$$Brown ppt$$

$$Brown precipitate is soluble in HNO_3$$

$$Fe(OH)_3 + 3HNO_3 \longrightarrow Fe(NO_3)_3 + 3H_2O$$

$$Soluble salt$$

Example 17.

A black coloured compound (A) on reaction with dil. H₂SO₄ gives a gas (B) which on passing in a solution of an acid (C) gives a white turbidity (D). Gas (B) when passed in acidified solution of (E) gives a precipitate (F) soluble in dilute HNO₃. After boiling this solution when excess of NH₄OH is added, a blue coloured compound (G) is formed. To this solution on addition of acetic acid and aqueous potassium ferrocyanide a chocolate coloured precipitate (H) is obtained. On addition of an aqueous solution of BaCl₂ to an aqueous solution of (E), a white precipitate insoluble in HNO₃ is obtained. Identify the compounds (A) to (H).

Solution:

Reactions involved may be given as

FeS +
$$H_2SO_4 \longrightarrow FeSO_4 + H_2S$$

Ferrous sulphide
Black (A)

 $H_2S + 2HNO_3 \longrightarrow 2NO_2 + 2H_2O + S^{\uparrow}$

(B)
(C)
Colloidal sulphur
(D) (Turbid)

 $CuSO_4 + H_2S \xrightarrow{HCl} CuS \downarrow + H_2SO_4$

(E)
Black ppt
(F)

$$3\text{CuS} + 8\text{HNO}_3 \longrightarrow 3\text{Cu}(\text{NO}_3)_2 + 2\text{NO} + 3\text{S} \downarrow + 4\text{H}_2\text{O}$$
(F)

$$Cu(NO_3)_2 + H_2SO_4 \longrightarrow CuSO_4 + 2HNO_3$$

$$CuSO_4 + 4NH_4OH \longrightarrow [Cu(NH_3)_4]SO_4 + 4H_2O$$

(Deep blue) (G)

$$[Cu(NH3)4]SO4 + 4CH3COOH \longrightarrow CuSO4 + 4CH3COONH4$$
(E)

$$CuSO_4 + BaCl_2 \longrightarrow BaSO_4 \downarrow + CuCl_2$$
White ppt

$$2CuSO_4 + K_4[Fe(CN)_6] \longrightarrow Cu_2[Fe(CN)_6] + 2K_2SO_4$$

Cupric ferrocyanide (Chocolate precipitate)

Example 18.

- (i) The yellow coloured precipitate of compound (A) is formed on passing H₂S through a neutral solution of salt (B).
- (ii) (A) is soluble in hot dilute HNO₃ but insoluble in yellow ammonium sulphide.
- (iii) The solution of (B) on treatment with small quantity of NH₃ gives white precipitate which becomes soluble in excess of it forming a compound (C).
- (iv) Solution of (B) gives white precipitate with small concentration of KCN which becomes soluble in excess of this reagent forming a compound (D).
- (v) The solution of (D) on treatment with H_2S gives (A).
- (vi) The solution of (B) in dilute HCl when treated with solution of BaCl₂ gives white precipitate of compound (E) which is insoluble in conc. HNO₃.

Identify the compounds (A) to (E).

Solution:

Yellow precipitate of CdS is (A).

(i)
$$CdSO_4 + H_2S \longrightarrow CdS \downarrow + H_2SO_4$$

(B) (A)

(ii)
$$CdS \downarrow + 2HNO_3 \longrightarrow Cd(NO_3)_2 + H_2S$$

Soluble
 $CdS \downarrow \longrightarrow Insoluble in yellow ammonium sulphide$
 $CdSO_4 + 2NH_4OH \longrightarrow Cd(OH)_2 + (NH_4)_2SO_4$

(iii)
$$Cd(OH)_2 + 4NH_4OH \longrightarrow [Cd(NH_3)_4](OH)_2 + 4H_2O$$

(C)

(iv)
$$CdSO_4 + 2KCN \longrightarrow Cd(CN)_2 \downarrow + K_2SO_4$$

White ppt
$$Cd(CN)_2 + 2KCN \longrightarrow K_2[Cd(CN)_4]$$
(D) Soluble

(v)
$$K_2[Cd(CN)_4] + H_2S \longrightarrow CdS \downarrow + 2KCN + 2HCN$$

(vi)
$$CdSO_4 + BaCl_2 \longrightarrow BaSO_4 \downarrow + CdCl_2$$

(E)

White precipitate of BaSO₄ is insoluble in HNO₃.

Example 19.

- (i) An aqueous solution of a compound (A) is acidic towards litmus and (A) is sublimed at about 300°C.
- (ii) (A) on treatment with an excess of NH₄SCN gives a red coloured compound (B) and on treatment with a solution of K₄[Fe(CN)₆] gives a blue coloured compound (C).
- (iii) (A) on heating with excess of K₂Cr₂O₇ in presence of concentrated H₂SO₄ evolves deep red vapours of (D).
- (iv) On passing the vapours of (D) into a solution of NaOH and then adding the solutions of acetic acid and lead acetate, a yellow precipitate of compound (E) is obtained.

Identify the compounds (A) to (E) and give chemical equations for the reactions at steps (ii) to (iv).

Solution:

(i) $FeCl_3 + 3H_2O \longrightarrow Fe(OH)_3 + 3HCl$ (A)

Solution becomes acidic due to hydrolysis. FeCl₃ sublimes at 300°C.

- (ii) $FeCl_3 + 3NH_4SCN \longrightarrow [Fe(CNS)_3] + 3NH_4Cl$ (C) Blood-red
- (iii) $4\text{FeCl}_3 + 9\text{H}_2\text{SO}_4 + 3\text{K}_2\text{Cr}_2\text{O}_7 \longrightarrow 6\text{CrO}_2\text{Cl}_2 + 2\text{Fe}_2(\text{SO}_4)_3 + 3\text{K}_2\text{SO}_4 + 9\text{H}_2\text{O}_4$ (D)

 Chromyl chloride
- (iv) $CrO_2Cl_2 + 4NaOH \longrightarrow 2NaCl + Na_2CrO_4 + 2H_2O$ $Na_2CrO_4 + (CH_3COO)_2Pb \longrightarrow PbCrO_4 + 2CH_3COONa$ (E) Yellow ppt

Example 20.

A mixture of two salts was treated as follows:

- (i) The mixture was heated with manganese dioxide and concentrated H₂SO₄, when yellowish green gas was liberated.
- (ii) The mixture on heating with NaOH solution gave a gas, which turned red litmus blue.
- (iii) Its solution in water gave blue precipitate with potassium ferricyanide and red colouration with NH₄CNS.
- (iv) The mixture was boiled with potassium hydroxide and the liberated gas was bubbled through an alkaline solution of K₂HgI₄ to give brown precipitate.

Identify the two salts. Give ionic reactions involved in the tests (i), (ii) and (iii).

Solution:

Test (ii) and (iv) show the presence of ammonium radical. Test (i) shows the presence of Cl⁻ ion and test (iii) shows the presence of Fe²⁺ and Fe³⁺ ion.

$$2Cl^{-} + MnO_{2} + H_{2}SO_{4} + 2H^{+} \longrightarrow MnSO_{4} + 2H_{2}O + Cl_{2}^{\uparrow}$$

$$Yellowish-green$$

$$NH_4^+ + OH^- \longrightarrow NH_3 + H_2O$$

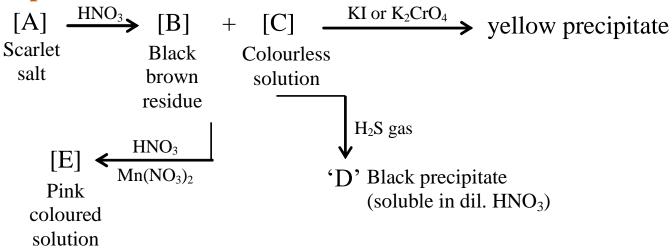

NH₃ turns red litmus paper blue.

$$3Fe^{2+} + 2[Fe(CN)_6]^{3-} \longrightarrow Fe_3[Fe(CN)_6]_2$$
Blue colouration

$$Fe^{3+} + 3CNS^{-} \longrightarrow [Fe(CNS)_3]$$
 Blood red colour

Thus, the mixture consists of FeCl₂ and NH₄Cl. Some of FeCl₂ has undergone oxidation into FeCl₃ with atmospheric oxygen.

Example 21.

What are the compound (A) to (E) in above road map problem? Give the reactions involved.

Solution:

Pb₃O₄ + 4HNO₃
$$\longrightarrow$$
 PbO₂ + 2Pb(NO₃)₂ + 2H₂O
(A) (B) (C)
Pb(NO₃)₂ + 2KI \longrightarrow PbI₂\(\psi + 2KNO₃\)
Yellow ppt
Pb(NO₃)₂ + K₂CrO₄ \longrightarrow PbCrO₄\(\psi + 2KNO₃\)
Yellow ppt
Pb(NO₃)₂ + H₂S \longrightarrow PbS\(\psi + 2HNO₃\)
(D) Black precipitate
PbO₂ + Mn²⁺ + HNO₃ \longrightarrow HMnO₄ + Pb²⁺
(E) Pink colouration

Example 22.

Compound (A) reduces HgCl₂ to a white precipitate, turning to gray. Solution of (A) turns yellow coloured solution of FeCl₃ to a green coloured solution. Solution of (A) gives white precipitate with NaOH, which dissolves in excess of NaOH. Moreover, the solution of (A) gives yellow precipitate, when H₂S gas is passed through it. This precipitate dissolves in yellow ammonium sulphide.

Compound (A) is found to give chromyl chloride test. Identify the compound (A) and give the reactions involved.

Solution:

sulphide

Compound (A) is
$$SnCl_2$$
.

 $SnCl_2 + 2HgCl_2 \longrightarrow Hg_2Cl_2 \downarrow + SnCl_4$

White ppt

 $SnCl_2 + Hg_2Cl_2 \longrightarrow 2Hg \downarrow + SnCl_4$

Grey ppt

 $SnCl_2 + 2FeCl_3 \longrightarrow SnCl_4 + 2FeCl_2$

Green

 $SnCl_2 + 2NaOH \longrightarrow Sn(OH)_2 \downarrow + 2NaCl$

White ppt

 $Sn(OH)_2 + 2NaOH \longrightarrow Na_2SnO_2 + 2H_2O$

Soluble

 $SnCl_2 + H_2S \longrightarrow 2HCl + SnS \downarrow$

Yellow ppt

 $SnS + (NH_4)_2S_2$

yellow ammonium

Soluble
